## EXECUTIVE SUMMARY

The groundwater monitoring at Operable Unit (OU) A of the Former Naval Complex, Adak, Alaska, was conducted in August and September 2012. The monitoring program for 2012 was implemented as described in the Comprehensive Monitoring Plan (CMP), Revision 5 (Navy 2012e); the 2012 updated CMP tables for Appendix A and B (Navy 2012b); and the Performance Statement of Work and Performance Requirements Summaries in the base contract award (Contract N44255-09-D-4005), Attachment H. Sealaska Environmental Services, LLC (Sealaska) conducted the 2012 monitoring activities from August 24 through September 15, 2012.

During the 2012 monitoring event, groundwater, surface water, and sediment samples were collected from 99 monitoring locations at 16 sites. Monitoring was conducted to satisfy OU A Record of Decision (ROD) (Navy et al. 2000) remedy requirements and post-free product recovery remedy requirements established under the State-Adak Environmental Restoration Agreement (Navy and ADEC 1994). Monitoring was conducted to assess the remedies of monitored natural attenuation, limited groundwater monitoring, surface water protection, and compliance.

Based on the previous monitoring results, the monitored natural attenuation remedies appear to be effective and biodegradation appears to be occurring to varying degrees at all of the monitored natural attenuation sites (Navy 2012c), and contaminant concentration data for 1999 through 2012 provide ample supporting evidence. Monitoring for natural attenuation parameters (NAPs) has been reduced from annually to every 5 years and was last conducted at 101 monitoring locations in 2009.

Comparisons to endpoint criteria stated in the CMP, Revision 5 (Navy 2012e) provide the basis for evaluating the effectiveness of the remedy and monitoring program at each site. The monitoring program is modified annually based on long-term monitoring (LTM) observations and in response to changing site conditions. The endpoint criteria apply human health and ecological risk-based criteria and the Alaska Department of Environmental Conservation (ADEC) (18 Alaska Administrative Code [AAC] 75.345) groundwater cleanup levels. At sites where groundwater is not considered as a drinking water source, 10 times the ADEC groundwater cleanup level is applied as endpoint criteria per decision documents.

General recommendations for the monitoring program include the following:

- Combine the Groundwater Monitoring and Landfill Monitoring Reports into one report for the 2013 monitoring program results.
- For all sites, reduce monitoring to every odd year with the next monitoring to occur in 2013.

Based on the 2012 monitoring program results, recommended changes in site-specific monitoring are presented below:

#### **Former Power Plant, Building T-1451**

For this site, the following changes to the monitoring program are recommended:

- The wells newly installed at this site in the summer of 2012 will be added to the monitoring program.

#### **General Communications, Inc. (GCI) Compound, Underground Storage Tank (UST) GCI-1**

For this site, the following changes to the monitoring program are recommended:

- Discontinue monitoring for DRO in all wells at the site.

#### **Naval Mobile Construction Battalion (NMCB) Building T-1416 Expanded Area**

For this site, the following changes to the monitoring program are recommended:

- Discontinue sampling at wells 02-452, 02-453, 02-455, 02-478, 02-817, NMCB-04, NMCB-08, and NMCB-12.
- Discontinue monitoring at well NMCB-05.
- Discontinue monitoring for benzene and DRO at the site.
- Beginning in 2013, reduce sampling at wells E-201 and 02-461 to every odd year.

#### **Resident Officer in Charge of Construction (ROICC)**

For this site, the following changes to the monitoring program are recommended:

- Discontinue monitoring at well 08-175.
- Change biennial monitoring at the site to every odd year with the next sampling occurring in 2013.

### **Runway 5/23 Avgas Valve Pit**

For this site, the following changes to the monitoring program are recommended:

- Change biennial monitoring at the site to every odd year with the next sampling occurring in 2013.

### **SA 78, Old Transportation Building, USTs 10583 and 10584, and Aboveground Storage Tanks (ASTs)**

For this site, the following change to the monitoring program is recommended:

- Discontinue monitoring at the site and recommend it for closure.

### **SA 79, Main Road Pipeline, South End and North End**

For this site, the following change to the monitoring program is recommended:

- Reduce monitoring at the site to every odd year with the next sampling occurring in 2013.

### **SA 80, Steam Plant 4, USTs 27089 and 27090**

For this site, the following changes to the monitoring program are recommended:

- Discontinue monitoring at wells 04-801 and SP4-2.
- Reduce monitoring at the site to every odd year with the next monitoring occurring in 2013.

### **South of Runway 18-36 Area**

For this site, the following changes to the monitoring program are recommended:

- Discontinue monitoring at wells: 02-518, E-209, RW-18/36-02, E-207, and Z3-2.
- Reduce monitoring at the site to every odd year with the next monitoring event occurring in 2013.

### **Solid Waste Management Unit (SWMU) 14, Old Pesticide Storage and Disposal Area**

For this site, the following change to the monitoring program is recommended:

- Reduce monitoring at this site to every odd year with the next monitoring to occur in 2013.

### **SWMU 17, Power Plant No. 3 Area**

For this site, the following changes to the monitoring program are recommended:

- Discontinue monitoring at wells 05-375, PP-05, and R-1.
- Reduce monitoring at this site to every odd year with the next monitoring to occur in 2013.

### **SWMU 58/SA 73, Heating Plant 6**

For this site, the following change to the monitoring program is recommended:

- Discontinue monitoring at the site and recommend it for closure.

### **SWMU 60, Tank Farm A**

For this site, the following change to the monitoring program is recommended:

- Reduce monitoring at wells LC5A and MW-E006 to every odd year with the next monitoring to occur in 2013.

### **SWMU 61, Tank Farm B**

For this site, the following changes to the monitoring program are recommended:

- Discontinue sampling in site surface water/sediment sample at location NL-D-04.
- Reduce monitoring at the site to every odd year with the next monitoring to occur in 2013.

### **SWMU 62, New Housing Fuel Leak Area**

For this site, the following changes to the monitoring program are recommended to Sandy Cove Housing Area:

- Discontinue monitoring at wells 03-895, 03-802, HMW-102-1, and HMW-146-3.
- Discontinue GRO and BTEX sampling in wells 03-104 and 03-778.
- Discontinue benzene sampling in well MW-187-1.
- Reduce monitoring at the Sandy Cove Housing area to every odd year with the next monitoring to occur in 2013.

For this site, the following changes to the monitoring program are recommended to Eagle Bay Housing Area:

- Discontinue monitoring at wells 03-107, 03-518, RW-303-12, HMW-303-1, HMW-303-9, CTO124-MW14, RW-303-9, HMW-303-2, HMW-303-10, RW-303-7, RW-303-06, and MW-303-14.
- Discontinue sampling for DRO at wells 03-103, 03-109, 03-898, and RW-303-14.
- Discontinue sampling for DRO at wells 03-502.

#### **Tanker Shed, UST 42494**

For this site, the following changes to the monitoring program are recommended:

- Discontinue sampling for GRO at wells 04-290, 04-306, and 04-601.
- Discontinue monitoring at wells 04-176, 04-178, 04-303, 04-304, 04-307, 04-308, 04-309, 04-310, 04-311, 04-314, 04-317, and TS-04.

LGM	limited groundwater monitoring
LTM	long-term monitoring
µg/L	micrograms per liter
mg/kg	milligrams per kilogram
mg/L	milligrams per liter
MLLW	mean lower low water
MNA	monitored natural attenuation
MPT	measured product thickness
mS/cm	milliSiemens per centimeter
MS/MSD	matrix spike/matrix spike duplicate
mV	millivolts
NA	not applicable or not available
NAP	natural attenuation parameter
NAVFAC	Naval Facilities Engineering Command
Navy	U.S. Navy
NC	not calculated or not collected
NIRIS	Naval Installation Restoration Information Solution
NMCB	Naval Mobile Construction Battalion
NORPAC	North Pacific
NP	not planned
NR	natural recovery

## ACRONYMS AND ABBREVIATIONS (continued)

NS	not sampled
NTU	nephelometric turbidity units
ORP	oxidation-reduction potential
OU	operable unit
PAH	polycyclic aromatic hydrocarbon
PCE	tetrachloroethylene
PR	percent recovery
QA	quality assurance
QC	quality control
RAO	remedial action objective
ROD	Record of Decision
ROICC	Resident Officer in Charge of Construction
RPD	relative percent difference
RRO	residual-range organics
S	Mann-Kendall statistic; the number of positive differences minus negative differences between sequential sampling results
SA	source area
SAA	spike amount added
SAERA	State-Adak Environmental Restoration Agreement
SD	sediment
Sealaska	Sealaska Environmental Services, LLC
SIM	selected ion monitoring
SOP	standard operating procedure
SR	sample result
SSR	spike sample result
SU	standard unit
SW	surface water
SWMU	solid waste management unit

## ACRONYMS AND ABBREVIATIONS (continued)

SWP	surface water protection
T	trace
TAC	The Aleut Corporation
TAH	total aromatic hydrocarbons
TAqH	total aqueous hydrocarbons
TCE	trichloroethylene
TCLP	toxicity characteristic leaching procedure
T/D-Mn	total and dissolved manganese
T/D-Pb	total and dissolved lead
T-Pb	total lead
TSS	total suspended solids
T-Tl	total thallium
URS	URS Group, Inc.
USGS	United States Geological Survey
UST	underground storage tank
VC	vinyl chloride
VOC	volatile organic compound

## DATA QUALIFIER DEFINITIONS

- D The reported result is from a dilution.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- J The reported result is an estimated concentration.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- U Analyte was not detected. Reported value is the reporting limit.
- UJ Analyte was not detected. Reported value is the reporting limit, which is estimated.
- X The reported result may have a slight high bias due to the presence of non-target background components.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

## **1. INTRODUCTION**

The 2012 annual groundwater monitoring at the Former Naval Complex located on Adak Island in southwest Alaska (Figure 1-1) was conducted during the months of August and September. Sealaska Environmental Services, LLC (Sealaska) performed groundwater monitoring, surface water and sediment sampling, and inspection activities for the Naval Facilities Engineering Command (NAVFAC) Northwest as part of a monitoring program for Operable Unit (OU) A. Groundwater, surface water, and sediment samples were collected at 16 sites in accordance with the Comprehensive Monitoring Plan (CMP), Revision 5 (Navy 2012e); the 2012 updated CMP tables for Appendix A and B (Navy 2012b); and Attachment H of the Performance Statement of Work and Performance Requirements Summaries in the base contract award (Contract N44255-09-D-4005). This report presents the results of the 2012 long-term monitoring (LTM) event.

### **1.1 PURPOSE OF MONITORING REPORT**

The purpose of this Annual Groundwater Monitoring Report is to present the 2012 monitoring results for the petroleum-release sites and the non-landfill Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) sites. This report summarizes the methods and results associated with sample collection and evaluates whether the remedies selected to address the impacted groundwater have met the specified endpoint criteria.

### **1.2 OBJECTIVES OF MONITORING REPORT**

This Annual Groundwater Monitoring Report has the following objectives:

- Summarize the 2012 annual groundwater, surface water, and sediment monitoring and field sampling activities at non-landfill CERCLA and petroleum-release sites at the Former Naval Complex;
- Present results of monitoring well, surface water/sediment sample locations, and shoreline inspections at non-landfill CERCLA and petroleum-release sites at the Former Naval Complex;
- Present site-specific results of chemical analyses conducted on groundwater, surface water, and sediment samples collected during the annual monitoring;
- Identify locations where target analytes exceed endpoint criteria;

- Evaluate the available data and any existing historical data for trends in concentrations of target analytes;
- Summarize free product recovery in 2012;
- Recommend modifications to sample collection activities for subsequent groundwater monitoring events;
- Collect data to support the 5-year review estimate of time required to reach endpoint criteria for those locations with a statistically significant downward trend for target analyte results; and
- Present site-specific recommendations to reduce monitoring frequency, terminate monitoring, or adjust monitoring, if appropriate.

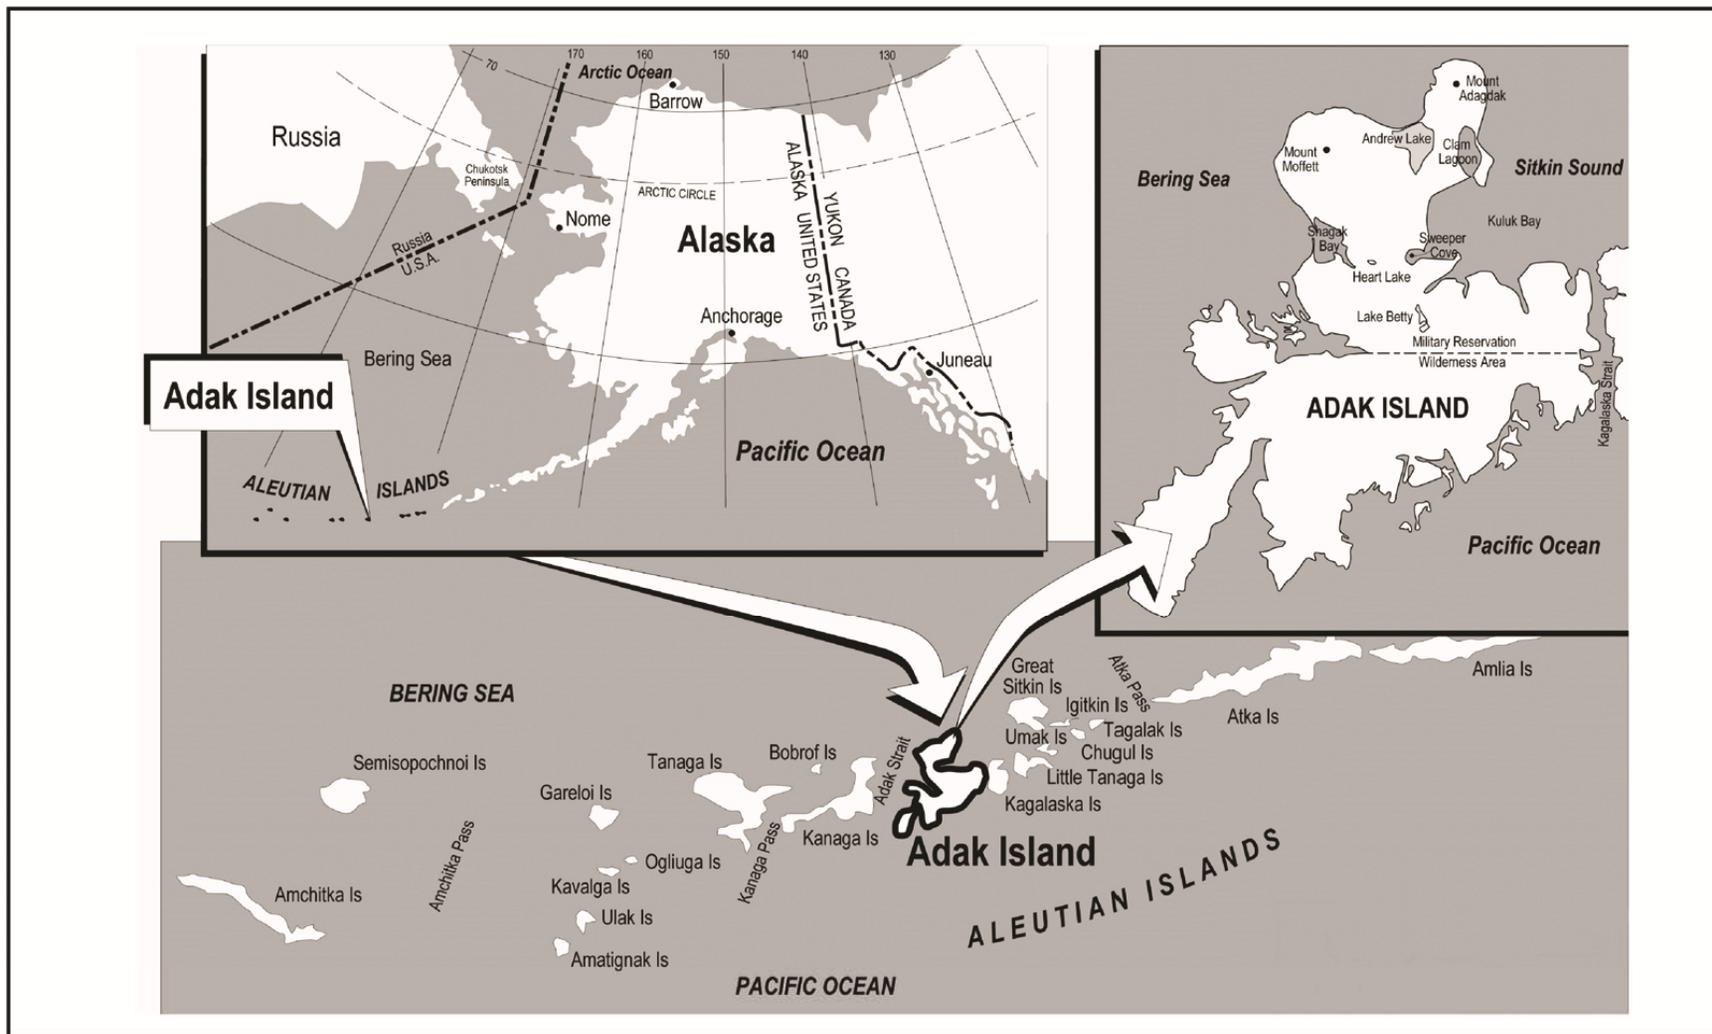

### **1.3 REPORT ORGANIZATION**

This annual groundwater monitoring report includes the following sections:

- Section 1 introduces the report and includes purpose and monitoring objectives.
- Section 2 presents a discussion of the LTM history and current LTM program.
- Section 3 presents monitoring endpoint criteria.
- Section 4 presents a summary of field activities associated with the groundwater, surface water, and sediment monitoring performed during 2012 at the petroleum-release sites and selected non-landfill CERCLA sites on the Former Naval Complex.
- Section 5 presents a summary of deviations from the CMP, Revision 5 (Navy 2012e).
- Section 6 presents the assessment of quantity and quality of the analytical results obtained from the 2012 monitoring and evaluates the usability of the data for the intended purpose.
- Sections 7 through 22 present, on a site-specific basis, the resulting data obtained during 2012 monitoring activities; a statistical review of the current and historical data with respect to trend determination and slope forecasting; a discussion of how analytical data compare with endpoint criteria; conclusions derived from natural attenuation monitoring; and recommendations for further monitoring activities based on groundwater monitoring results.
- Section 23 contains references used in the development of this report.

- The appendices include the following additional documentation:
  - Appendix A, Field Forms and Logbook
  - Appendix B, Sampling Deviation Forms
  - Appendix C, Data Summary Table—1999 Through 2012
  - Appendix D, Summary of 2012 and Historical Depth-to-Water Measurements
  - Appendix E, Well Maintenance and Repair List
  - Appendix F, 2012 Data Validation Reports and Laboratory Analytical Data
  - Appendix G, Data Quality Assessment Summaries
  - Appendix H, Statistical Calculations
  - Appendix I, Photographic Log
  - Appendix J, Free Product Recovery Summary
  - Appendix K, Tide Charts
  - Appendix L, Response to Regulator Comments

## **2. SITE DESCRIPTION AND ENVIRONMENTAL HISTORY**

### **2.1 SITE DESCRIPTION**

Adak Island is remotely located in the Aleutian Island chain in the Bering Sea, approximately 1,500 miles southwest of Anchorage, Alaska (Figure 1-1). Adak is surrounded by other islands, most notably Great Sitkin Island on the east and the volcanically active Kasatochi, 40 miles to the northeast. Adak Island is mountainous with rugged terrain and is approximately 15 miles in length. Because Adak typically experiences severe weather (cold and high winds), the island is naturally treeless and is covered by tundra typified by waist-high, hardy grass, lupin, fireweed, and cow parsnips.

The City of Adak is located on the northern half of the island and includes a commercial airfield and airport, school, health clinic, general store, and bar. In 2012, approximately 100 residents lived on the island full- or part-time. The main commercial industry is fishing and fish processing, followed by tourism. Numerous structures remain on the island that were built to support the former naval complex and which are now owned by The Aleut Corporation (TAC). Some structures are still being used, but many are dilapidated and in poor condition. Resources on the island are limited and expensive. Typical access to the island is by commercial air service, which is offered twice a week by Alaska Airlines. A clinic provides limited medical services, and emergency air-lift medical services are available from Anchorage.

Adak Island was first used by military forces of the United States in 1942. Various branches of the military used the island beginning in 1942, and in 1950 the facility became a naval complex. Military use of the island has resulted in environmental impacts to soil and groundwater by several chemicals and products, including petroleum hydrocarbon compounds. A number of environmental restoration programs were initiated as early as 1986 to address these issues, and this monitoring program is part of the remedies implemented under the OU A ROD (Navy et al. 2000).

### **2.2 LONG-TERM MONITORING PROGRAM**

The monitoring program reported herein addresses historical and ongoing monitoring requirements for 24 petroleum-release and non-landfill CERCLA sites. Since long-term monitoring commence in 2003, six of the 24 sites have met endpoint criteria and have received conditional closure or closure is pending. In addition, monitoring at many wells has been discontinued or reduced to biennial sampling because endpoints have been met or

contaminant concentrations have exhibited decreasing trends. Table 2-14 lists the monitoring history for the 24 sites since 2003 and changes to the sampling protocols as endpoints were met or site conditions were changed.

The CERCLA sites associated with landfills (Palisades, Metals, White Alice, and Roberts) have been addressed in a separate landfill monitoring report. Monitoring at landfill sites did not occur during 2012 due to a reduction in the monitoring frequency but will occur in 2013 as per the CMP, Revision 5. Beginning in 2013, the landfill and groundwater reports will be combined. CERCLA sites not associated with landfills and which are included in this report are:

- Solid Waste Management Unit (SWMU) 14, Old Pesticide Disposal Area
- SWMU 15, Future Jobs/Defense Reutilization Marketing Office (DRMO)
- SWMU 17, Power Plant No. 3 Area
- SWMU 55, Public Works Transportation Department Waste Storage Area

All of the selected remedies described for the non-landfill CERCLA sites in the OU A ROD, include institutional controls (ICs). An Institutional Control Management Plan (ICMP) consistent with the OU A ROD was prepared by the U. S. Navy (Navy) and approved by the U.S. Environmental Protection Agency (EPA) and Alaska Department of Environmental Conservation (ADEC) in 2000. The ICMP was updated by the Navy in 2012 and is included in the CMP, Revision 5 (Navy 2012e). IC inspections occurred concurrently with LTM field activities in 2013 and results of the inspections are presented in the IC Inspection Report (Navy 2012a).

### **2.3 MONITORING PERFORMED IN 2012**

Table 2-2 summarizes the 2012 LTM sites with their current remedies that have not yet received closure or are scheduled to be monitored on odd years only. Table 2-2 also identifies the petroleum sites with no unacceptable risks for which groundwater is not considered a drinking water source. Endpoint criteria for this category are established at 10 times the ADEC cleanup levels (see Section 3 for a more in-depth discussion of endpoint criteria). Figure 2-1 shows the locations for all sites monitored in 2012.

Table 2-3 summarizes interim and current remedies and the monitoring purpose for each sampling location for the 2012 sampling event. The types of monitoring implemented at the OU A sites in 2012 include:

- Monitored natural attenuation (MNA)
- Free product recovery
- Compliance monitoring
- Natural recovery (for surface water bodies)
- Surface water protection monitoring

The purpose of the MNA, free product recovery, compliance monitoring, and natural recovery is to determine whether the selected remedy is effective and endpoint criteria have been met. The purpose for surface water protection monitoring is to detect migration of petroleum hydrocarbons into unaffected areas and to verify that petroleum-related chemicals are not migrating toward downgradient surface water bodies (i.e., Sweeper Cove, Sweeper Creek, Kuluk Bay, and Clam Lagoon).

**SEALASKA**

### **3. MONITORING TYPES AND ENDPOINTS**

Monitoring endpoints are specified in the CMP, Revision 5 (Navy 2012e). Chemical-specific criteria are used as a means of quantitatively evaluating the progress of a remedy toward achieving the remedial action objectives (RAOs) stated in the OU A ROD. Therefore, environmental restoration requires regular monitoring of groundwater at petroleum and non-landfill CERCLA sites to assess concentrations and trends relative to monitoring endpoints. Endpoint criteria are represented by a set of chemical-specific conditions that indicate whether the RAO has been met and monitoring can be terminated. Whether endpoints are met is evaluated on a chemical-specific basis. Specific endpoint criteria are described herein by monitoring type.

#### **3.1 PETROLEUM MONITORING**

The following five separate conditions are possible regarding monitoring endpoints at petroleum sites:

- Conditions meet endpoint criteria, and monitoring may be reduced or terminated.
- Conditions meet endpoint criteria, and monitoring is continued due to other existing conditions at the site (e.g., contaminated upgradient wells).
- Conditions do not meet endpoint criteria, and monitoring will continue at the existing frequency.
- Conditions do not meet endpoint criteria, but conditions are such that monitoring frequency can be reduced.
- Conditions do not meet endpoint criteria, but conditions are such that the site remedy will be evaluated.

Target analytes for petroleum monitoring sites are specified in the OU A ROD, Section 10.3.2, to be site specific, and not all ROD-listed target analytes are analyzed at every site. The site-specific analyses selected for the monitoring program of each site are based on historical results and the nature of the release. The following are the 2012 target analytes for petroleum monitoring sites:

- Gasoline-range organics (GRO)
- Benzene, toluene, ethylbenzene, and total xylenes (BTEX)
- Diesel-range organics (DRO)
- Total and dissolved lead

### 3.1.1 Monitored Natural Attenuation Groundwater Sites

Natural attenuation monitoring is conducted at sites with the ROD- and State-Adak Environmental Restoration Agreement (SAERA)-selected remedy of MNA. The LTM at MNA sites includes the following:

- Track contaminant concentrations in groundwater, surface water, and sediment (depending on the site) over time at the monitored sites;
- Monitor remedy performance and compliance;
- Evaluate contaminant concentrations and trends in these media relative to monitoring endpoints; and
- Based on the evaluation of contaminant concentrations and trends by media relative to monitoring endpoints, document the current status of each monitored site or monitoring location relative to the chemical- and media-specific endpoints and RAOs stated in the OU A ROD.

MNA has been selected as the final remedy for 16 sites. Monitoring is considered complete at a given location if chemical concentrations are below the primary endpoint criteria for two consecutive monitoring events, with the exception of sites Naval Mobile Construction Battalion (NMCB), South of Runway 18-36, and SWMU 62, which require three consecutive monitoring events. Table 3-1 lists the groundwater chemical endpoint criteria for petroleum and non-landfill CERCLA sites.

Four petroleum sites were identified as having no unacceptable human health and ecological risks, and groundwater at those sites is not considered a current or potentially future drinking water source. Endpoint criteria for these sites are established at 10 times the groundwater chemical endpoint criteria and are identified in the list below. MNA sampling was conducted at the following sites during September 2012:

- Former Power Plant, Building T-1451
- General Communications, Inc. (GCI) Compound, Underground Storage Tank (UST) GC-1
- NMCB Building T-1416 (10 times cleanup levels)
- Resident Officer in Charge of Construction (ROICC) Contractor's Area, UST ROICC-7
- Runway 5-23 Avgas Valve Pit

**Table 3-1.** Petroleum and Non-Landfill CERCLA Site Monitoring Endpoints for Target Analytes in Groundwater

<b>Target Analyte</b>	<b>Alaska Cleanup Levels 18 AAC 75.345 (µg/L)<sup>1</sup></b>
<b>Volatile Organic Compounds</b>	
1,1-Dichloroethene	7
Cis-1,2-dichloroethene	70
Trans-1,2-dichloroethene	100
Benzene	5
Ethylbenzene	700
Methylene chloride	5
Tetrachloroethylene	5
Toluene	1,000
Total xylenes	10,000
Trichloroethylene	5
Vinyl chloride	2
<b>Semivolatile Organic Compounds</b>	
Bis(2-ethylhexyl)phthalate	6
<b>Petroleum Hydrocarbons</b>	
Gasoline-range organics	1,300 <sup>2</sup>
Diesel-range organics	1,500
<b>Inorganics</b>	
Lead	15

*Notes:*

<sup>1</sup> Cleanup levels shown are applicable if groundwater is a source of drinking water at the site. A concentration equal to 10 times the concentration shown may be used if groundwater is not a current source of drinking water, or groundwater is not a reasonably expected future source of drinking water.

<sup>2</sup> Standard is based on estimated solubility.

- Source Area (SA) 78, Old Transportation Building, USTs 10583 and 10584, and Aboveground Storage Tanks (ASTs) (10 times cleanup levels)
- SA 79, Main Road Pipeline, South End
- SA 80, Steam Plant 4, USTs 27089 and 27090
- South of Runway 18-36 (10 times cleanup levels)
- SWMU 14, Old Pesticide Storage and Disposal Area
- SWMU 17, Power Plant No. 3 (10 times cleanup levels)
- SWMU 58/SA 73, Heating Plant 6 (10 times cleanup levels)
- SWMU 60, Tank Farm A
- SWMU 61, Tank Farm B
- SWMU 62, New Housing Fuel Leak
- Tanker Shed, UST 42494

Natural attenuation of petroleum hydrocarbons has been demonstrated on Adak Island. As a result, the CMP, Revision 5 (Navy 2012e) prescribed natural attenuation parameter (NAP) monitoring once every 5 years. This monitoring was conducted in 2009. One of the stated objectives in the OU A ROD for these sites is to estimate the rate of natural attenuation to demonstrate achievement of the primary endpoint criteria within 75 years. As a secondary endpoint criteria, monitoring at a specific location could be substantially reduced if it can be demonstrated that:

- The concentrations are decreasing at a predictable rate with a degree of confidence of at least 80 percent; and
- The exceedance poses no reasonable threat to downgradient receptors.

If monitoring demonstrates that both of these secondary endpoint criteria are met, then it will be concluded that natural attenuation is progressing as predicted, groundwater in the area poses no threat to humans or the environment, and further monitoring can be substantially reduced (e.g., in frequency, location, or analyte) as defined in the CMP, Revision 5 (Navy 2012e).

To determine whether secondary endpoint criteria are achieved, a trend evaluation was performed for well locations where exceedances of the primary endpoint criteria have occurred. As specified by the CMP, Revision 5 (Navy 2012e), trend evaluations were performed when at least four monitoring data points were available. Trend analyses were performed on concentrations of at least one analyte in a total of 38 wells during 2012.

Monitoring will be continued if the trend evaluation determines that the primary endpoint criteria are not met, as evidenced by:

- Decrease in concentrations over time, but non-demonstrability that the exceedances pose no reasonable threat to downgradient receptors; or
- No significant change in concentrations observed, and no trend line found outside the confidence interval (i.e., the concentration trend is uncertain).

If the data tests indicate that the concentrations are increasing, an evaluation will be performed to determine whether to continue monitoring or take additional action.

The effectiveness of the selected remedies will be evaluated during the 5-year reviews. NAP sampling will be conducted every 5 years and was last conducted during the 2009 field event. The MNA remedy for these sites was evaluated during the 5-year review in 2011 to determine whether natural attenuation is still being demonstrated in groundwater. The 5-year

review presents the results of monitoring conducted up to that time and identifies future actions as necessary. If the 5-year review demonstrates that MNA will not achieve the primary endpoint criteria within the 75-year time frame at a site, enhancement of MNA or the use of alternative remedial actions will be evaluated and discussed with ADEC.

### **Statistical Trend Analysis Methods**

Before statistical trend analysis was performed, the applicable chemical data from the monitoring wells for the 1999 through 2012 period were compiled and reviewed for a qualitative assessment of the suitability, comparability, and representativeness of the historical data (i.e., a historical data usability assessment). This time frame was selected because it would allow capture of 4 to 10 sampling periods (and meet the minimum number of four data points required for the Mann-Kendall test) and exhibit any long-term characteristics or trends in the data. Statistical trend analysis for the compounds of interest occurring in samples from the site monitoring wells was accomplished using the Mann-Kendall test, which is a non-parametric statistical test used to evaluate trends in data over time. It tests the null hypothesis (H<sub>0</sub>) at both the 80 and 95 percent confidence intervals. As specified in the CMP, Revision 5 (Navy 2012e), trend analysis was performed for analytes in groundwater which exceeded endpoint criteria during the previous two sampling events. The analysis output indicates whether parameter trends are 1) increasing, 2) decreasing, or 3) exhibiting no trend. If no trend is indicated, a coefficient of variation assessment is made to evaluate parameter stability and determine whether concentrations are stable or unstable. Because the chemical data were collected in August and September of each year, no analysis of seasonal trend can be conducted, and the Mann-Kendall test rather than a Seasonal Kendall test is appropriate.

If a statistically significant decreasing trend was identified in the Mann-Kendall trend analysis, Sen's slope estimate was used to calculate the overall median slope. Sen's procedure is a non-parametric statistical test that calculates the true slope of a linear trend by evaluating the median slope for all the pairs of samples as an estimate of the overall slope. This methodology is less sensitive to outliers or missing data as compared to conventional linear regression techniques. To ensure the calculated confidence intervals were relevant, Sen's evaluation was performed on data for which sampling events were not more than 2 years apart. As defined in the CMP, Revision 5 (Navy 2012e), one-half the detection limit was used if analytical results were not detected.

Trend evaluations were not performed in 2012 for wells that are scheduled to be sampled every odd year and were not sampled in 2012. Trends for these wells were conducted in 2011

and are included in the Final 2011 Annual Groundwater Monitoring Report (Navy 2012c). Trend evaluations will be performed for wells sampled biennially and reported in the subsequent Annual Groundwater Monitoring Report as prescribed by the CMP, Revision 5 (Navy 2012e). Statistical calculations for each site are listed in Appendix H.

### **3.2 SURFACE WATER PROTECTION GROUNDWATER MONITORING ENDPOINT**

The OU A ROD (Navy et al. 2000, Section 10.3) specifies that groundwater monitoring will be conducted for CERCLA and petroleum-related chemicals at sites where concentrations in groundwater exceed water quality criteria and groundwater could discharge into a regulated surface water body. In general, surface water protection monitoring is being conducted at a limited number of wells positioned downgradient of free product sites between the source area and a surface water body. The purpose of surface water protection monitoring is to monitor for migration of free product or dissolved contaminants into an area that is currently not impacted and thus to provide an early warning of potential migration to the associated surface water body. The surface water bodies specified by the OU A ROD for monitoring are Sweeper Cove, North Sweeper Creek, South Sweeper Creek, Kuluk Bay, and Clam Lagoon.

Because several petroleum release sites on Adak Island are located upgradient from these five water bodies, selected monitoring locations at these sites are designated for surface water protection monitoring. This monitoring was planned at the following 36 sampling locations during the 2012 monitoring event:

- Former Power Plant, Building T-1451, locations 01-151 and NL-08
- NMCB Building T-1416, locations 02-453, 02-455, 02-479, 02-818, NMCB-07, NMCB-08, NMCB-10, NMCB-11, NMCB-12, and NL-05
- SA 78, Old Transportation Building, locations 12-802 and NL-10
- SA 79, Main Road Pipeline, South End, location 02-230
- South of Runway 18-36 Area, locations 02-231, 02-232, and AS-1
- SWMU 60, Tank Farm A, locations LC5A, 650, 651, 652, 653, and 852
- SWMU 61, Tank Farm B, locations 14-113, 14-210, NL-04, and NL-D-04
- SWMU 62, New Housing Fuel Leak, locations AMW-704, 03-109, 03-898, RW-303-13, RW-303-14, RW-303-16, and NL-09
- Tanker Shed, UST 42494, location 04-601

The chemical-specific criteria applicable to surface water are specified in the Alaska Water Quality Standards (18 Alaska Administrative Code [AAC] 70.020[b][5][A][iii]). For sites with BTEX and GRO as contaminants of concern, the criteria specify that total aqueous hydrocarbons (TAqH) (sum of BTEX and polycyclic aromatic hydrocarbon [PAH] concentrations) in the water column may not exceed 15 micrograms per liter ( $\mu\text{g/L}$ ) and total aromatic hydrocarbons (TAH) (sum of BTEX concentrations) may not exceed 10  $\mu\text{g/L}$ . The point of compliance for achieving these surface water criteria is established at the soil/surface water interface by ADEC (ADEC 2001).

The surface water protection monitoring regime uses analytical results for groundwater samples collected from wells adjacent to or upgradient from receiving surface water bodies. The evaluation compares analytical results for petroleum compounds to the Alaska Water Quality Standards (18 AAC 70). If this comparison indicates an exceedance and a significant increase in concentrations over three measurements at a surface water protection monitoring location, the following actions will be initiated:

- Evaluation of chemicals and their concentrations identified in surface water protection wells relative to the potential for a reasonable threat to downgradient aquatic receptors;
- Evaluation and planning for collection of one upgradient and one downgradient surface water sample at the soil/surface water interface closest to the subject sentinel well location;
- Review of the final remedy selected for the nearest upgradient site, and evaluation of the remedy performance relative to surface water protection criteria; and
- Initiation of free product recovery in surface water protection wells where the presence of free product is indicated by an interface probe.

The endpoint for surface water protection monitoring depends directly on the associated upgradient site achieving the remedial endpoint criteria. Once the upgradient site has achieved the remedial endpoint and it can be demonstrated that no reasonable threat to the downgradient receptor exists, surface water monitoring at the associated location will be terminated.

### **3.3 CERCLA COMPLIANCE GROUNDWATER MONITORING**

Compliance monitoring is conducted at sites where CERCLA-regulated chemicals have been identified as target analytes. The purpose of compliance monitoring is to evaluate whether target analyte concentrations in the groundwater comply with the endpoint criteria.

CERCLA groundwater monitoring was conducted at the following non-landfill sites during the 2012 monitoring event:

- SWMU 14, Old Pesticide Storage and Disposal Area
- SWMU 17, Power Plant No. 3 Area

Target analytes for CERCLA groundwater monitoring are specified by site and monitoring location (see Table 2-4). Compounds detected during each CERCLA annual monitoring event are evaluated for inclusion or removal as target analytes, based on a comparison to endpoint criteria. Revisions to the target analyte list and monitoring frequency are made in the negotiated recommendations in the annual groundwater monitoring reports, 5-year reviews, and revisions to the CMP.

The groundwater monitoring program was expanded, on a site-specific basis, to include the monochlorinated and dichlorinated daughter product compounds of the target analytes specified in the OU A ROD. In general, remedy evaluations and trends are conducted using only those analytes specified in the OU A ROD. In some cases, however (e.g., SWMU 17), trend analysis also included additional chlorinated volatile organic compound (VOC) daughter products.

Compliance monitoring will be considered complete at a given location if concentrations of the target analytes are below the endpoint criteria as specified by 18 AAC 75.345 (Table 3-1) for two consecutive sampling rounds. A secondary endpoint can be established based on the trend evaluation discussed in Section 3.1.1, if the following can be demonstrated (Navy et al. 2000):

- The concentrations are decreasing at a predictable rate with a degree of confidence of at least 80 percent; or
- The exceedance poses no reasonable threat to downgradient receptors.

Generally, if the trend evaluation does not indicate that an endpoint has been met, monitoring will continue as required. Additional data reviews will be performed after every fifth year until a monitoring endpoint is reached. If the analysis indicates that the concentration is increasing, the Navy, in consultation with ADEC and EPA, will determine the appropriate course of action. Trend evaluations for chlorinated VOCs are performed in the same manner as for petroleum compounds.

The results and analyses of the compliance monitoring are summarized annually. Discussion of the need for continued compliance monitoring and recommended changes to the

compliance monitoring program (i.e., increase frequency, decrease frequency, or discontinue) will be presented in the 5-year review document.

### **3.4 NATURAL RECOVERY/SEDIMENT AND SURFACE WATER MONITORING**

Based on the Final Decision Document South of Runway 18-36, August 2006, natural recovery with monitoring was the selected remedy. Sediment and surface water monitoring was conducted at the following two sites during the 2012 monitoring event in South Sweeper Creek:

- South of Runway 18-36 Area, locations NSWSD-2, NSWSD-4, NSWSD-5, NSWSD-7, and NSWSD-8
- SWMU 60, Tank Farm A, location 852

Additionally, surface water sampling, sediment sampling, or both were conducted at shoreline locations of identified or suspected petroleum seeps. Seep sampling was conducted at the following sites:

- Former Power Plant, Building T-1451, location NL-08 (East Canal)
- NMCB Building T-1416, location NL-05 (Sweeper Cove)
- SWMU 61, Tank Farm B, locations NL-04 and NL-04D (North Sweeper Creek)
- SWMU 62, New Housing Fuel Leak Area, location NL-09 (East Canal)

One sample of surface water and sediment was planned to be collected at SA 78, Old Transportation Building, location NL-10, along the shoreline of Clam Lagoon if petroleum contamination was observed. No contamination was observed during the field activities, so no samples were collected at this location.

For sites with natural recovery as a remedy, surface water and sediment monitoring is conducted until petroleum concentrations in surface water and sediment are below the risk-based cleanup levels, as established by the risk assessment, and petroleum concentrations in surface water are below ADEC water quality standards. The purpose of the sediment monitoring is to demonstrate that petroleum hydrocarbons in shoreline or bottom sediments are not causing deleterious effects to aquatic life. The purpose of the surface water monitoring is to demonstrate that surface waters and adjoining shorelines remain free from floating oil, film, sheen, or discoloration and meet the cleanup levels established in 18 AAC 70 for TAH and TAqH.

All surface water and sediment samples were collected at the same locations as in previous years. Sample locations were determined through negotiations with EPA and ADEC and guided by the observable presence of petroleum contamination, groundwater seep, or both.

Chemicals of concern in sediment and surface water for these sites and cleanup levels have been established for South Sweeper Creek at the South of Runway 18-36 Area (Table 3-2). The cleanup levels for both sediment and surface water at this site are based on the results of the risk assessment (Navy and ADEC 2005). These risk-based cleanup levels were set at the risk-based screening criteria for the chemicals that potentially pose an unacceptable ecological risk. Because no criteria have been established for other sites, analytical results for the surface water and sediment samples at the other sites will be compared to South of Runway 18-36 cleanup levels; however, these cleanup levels may not correlate to the ecological risks associated with the other sites and may not accurately reflect whether surface water and sediments are being impacted by on-site contamination at unacceptable levels of risk.

**Table 3-2.** Sediment and Surface Water Cleanup Levels for South of Runway 18-36, South Sweeper Creek

Chemical	Sediment	Surface Water	
	Risk-Based Cleanup Levels <sup>1,2</sup> (mg/kg)	Risk-Based Cleanup Levels <sup>1,2</sup> (µg/L)	ADEC Quality Standards <sup>2</sup> (µg/L)
<b>Total Petroleum Hydrocarbons</b>			
DRO	90.6	250	NA
GRO	12.2	114	NA
TAH	NA	NA	10
TAqH	NA	NA	15
<b>Polycyclic Aromatic Hydrocarbons</b>			
2-Methylnaphthalene	0.0202	NC	NA
Indeno(1,2,3-cd)pyrene	NC	0.28	NA
Phenanthrene	0.225	NC	NA

*Notes:*  
<sup>1</sup> Used as screening criteria to determine potential extent of contamination.  
<sup>2</sup> Used as cleanup levels for remediation.

In addition, the ADEC surface water quality standards, established by Alaska Regulation 18 AAC 70, are applicable to surface water at all sites. These standards include numerical criteria for TAH and TAqH (Table 3-2) and the following standards:

- Petroleum hydrocarbons in shoreline or bottom sediments may not cause deleterious effects to aquatic life; and
- Surface waters and adjoining shorelines must be virtually free from floating oil, film, sheen, or discoloration.

Natural recovery monitoring will be conducted until petroleum concentrations in surface water and sediment are below the risk-based cleanup levels, as established by the risk assessment, and petroleum concentrations in surface water are below ADEC water quality standards (TAqH and TAH). Natural recovery will be discontinued once the risk-based cleanup levels for surface water and sediment and the ADEC water quality standards for sheen, TAqH, and TAH are achieved during three consecutive monitoring events in all samples collected at the site.

## 4. SAMPLING PROGRAM

This section describes the sampling program, including field procedures and sampling requirements, for the 2012 annual groundwater monitoring at the OU A sites. Field activities included groundwater sampling, collection of groundwater quality parameter measurements, surface water sampling, sediment sampling, product thickness measurements, depth-to-groundwater measurements, shoreline inspections, well inspections, and handling of investigation-derived waste (IDW). All 2012 monitoring activities followed the CMP, Revision 5 (Navy 2012e) and the updated CMP Appendix A and B tables (Navy 2012b). Updates to the CMP Appendix A and B tables were based on the recommendations in the Final 2011 Groundwater Monitoring Report (Navy 2012c) which were negotiated with ADEC and EPA.

Monitoring activities occurred from August 24 through September 15, 2012. During the monitoring event, groundwater sample collection was performed at 83 groundwater monitoring locations for 16 sites (Figure 2-1), and 7 surface water and 9 sediment samples were collected from locations at 6 sites. Product thickness and depth-to-water measurements were performed at 170 locations from these sites. Standard operating procedures (SOPs) and Stand-Alone Specific Instructions from the CMP, Revision 5 (Navy 2012e) were followed for sample collection activities. Copies of the field forms and logbooks documenting 2012 field activities are included in Appendix A.

### 4.1 FIELD ACTIVITIES

Table 4-1 summarizes the 2012 field activities by site and location. Table 4-2 summarizes the environmental quantities and laboratory analytical methods performed on groundwater, surface water, and sediment samples that were collected in 2012 by location.

#### 4.1.1 Field Measurements

Field measurements recorded during 2012 groundwater monitoring activities included the physical measurements of depth-to-groundwater and product thickness. Water level and free product measurements were taken at 170 wells. NAVFAC SOP I-D-5 (Water Level Measurements) and Stand-Alone Specific Instruction #3 (Well Measurements) were followed during the collection of depth-to-groundwater and product thickness measurements. Water levels and product thicknesses are presented in Appendix D. Water levels were corrected if floating product was observed in the wells by using the following equation:

$$DTW_C = DTW_M - ( [\rho_{Inapl} / \rho_{water}] * MPT )$$

Where:  $\rho_{\text{Inapl}}$  – density of light non-aqueous phase liquid  
 $\rho_{\text{water}}$  – density of water (1,000 kilograms per cubic meter [ $\text{kg}/\text{m}^3$ ])  
 $\text{DTW}_C$  – corrected depth-to-water  
 $\text{DTW}_M$  – measured depth-to-water  
MPT – measured product thickness

The type of product present in each affected well was determined to be either diesel or gasoline, and the appropriate light non-aqueous phase liquid density was used in the correction equation. The density used was 820 kilograms per cubic meter ( $\text{kg}/\text{m}^3$ ) for diesel and 737.22  $\text{kg}/\text{m}^3$  for gasoline (SImetric 2007). Analytical results for each affected well were reviewed and the fuel with the highest concentration was selected. If equal concentrations of gasoline and diesel were found, diesel was selected based on the assumption that the gasoline was weathered and had a higher density and therefore, the density of diesel best approximated that of the product in the well. If a well had no analytical results associated with it, results for nearby wells at the same site were used for the product selection.

Corrected groundwater elevations were used to interpret groundwater flow direction based on potentiometric surface. For some sites, an insufficient number of wells exist to calculate a potentiometric surface, so at these sites, groundwater flow direction was estimated based on historical studies and topographic surface. Groundwater flow direction at all LTM sites has been well established through the collection of groundwater elevation data since 2005. Since then, groundwater flow direction has not varied at any site. Groundwater elevations collected in 2012 were compared to historical elevations presented in Appendix D-2. For all LTM sites monitored in 2012, groundwater flow directions remained consistent with previous interpreted flow directions.

Field measurements recorded during 2012 groundwater monitoring activities also included the collection of the water quality parameter measurements of pH, oxidation-reduction potential (ORP), specific conductance, turbidity, dissolved oxygen (DO), temperature, and salinity. NAVFAC SOP I-D-7 (Field Parameter Measurement) was followed for all water quality parameter measurements. Measurements of water quality parameters were recorded approximately every 3 minutes during evacuation of water from each well to determine that groundwater parameters had stabilized before the groundwater sample was collected. These field measurements were collected using a Horiba U-22 water quality meter. Once each parameter stabilized or three well casing volumes were removed (by low-flow sampling method), a sample was collected for laboratory analysis. The resultant data were used to verify samples representative of actual groundwater conditions. Final water quality parameter measurements are presented for each well by site in Sections 7 through 22.

#### **4.1.2 Natural Attenuation Parameters Assessment**

Reduction of dissolved petroleum concentrations in groundwater through natural attenuation has been demonstrated with data collected from previous sampling efforts. Biodegradation of petroleum hydrocarbons varies depending on the type of hydrocarbon. Gasoline and jet fuel no. 5 (JP-5) were the most extensively used hydrocarbons on Adak Island. Gasoline is composed primarily of relatively volatile hydrocarbons containing 4 to 12 carbon atoms, including the BTEX compounds. JP-5 is a kerosene-based fuel composed primarily of relatively low-volatility hydrocarbons containing 11 to 13 carbon atoms and relatively insignificant (less than 1 percent by weight mass fraction) BTEX content.

The biodegradation of BTEX compounds to form the final end product of carbon dioxide is a generally well understood process. The efficiency of biodegradation is primarily a function of the availability of the various electron acceptors that may be used in the reactions as well as the presence of the appropriate microorganisms and enzymes. Oxygen is by far the most favorable electron acceptor, and BTEX degradation is relatively fast and efficient in aerobic groundwater. When DO is depleted within a contaminant plume, nitrate is the next most favorable electron acceptor, followed by manganese, ferric iron, sulfate, and carbon dioxide. All these anaerobic biodegradation processes are slower than aerobic processes; benzene degradation is particularly slow when carbon dioxide is the only available electron acceptor. Manganese is not usually considered an important electron acceptor because it generally is not abundant in aquifer sediments. The biodegradation of the various longer chained hydrocarbons that make up JP-5 is a less understood process, although aerobic degradation generally remains more rapid than anaerobic degradation (USGS 2005).

A universal indicator of hydrocarbon biodegradation is an accumulation of the end product carbon dioxide. An indication of aerobic hydrocarbon degradation is depletion of DO within a plume. An indication of hydrocarbon degradation linked to nitrate reduction is the depletion of nitrate (relative to upgradient concentrations) and a possible accumulation of nitrite, although nitrite generally is short-lived in shallow groundwater and was not analyzed in this study. An indication of hydrocarbon degradation linked to iron reduction is the accumulation of ferrous iron. Ferrous iron is the soluble by-product of iron reduction, and the oxidized ferric iron that serves as electron acceptors is primarily in a non-soluble state associated with aquifer sediments. An indication of hydrocarbon degradation linked to sulfate reduction is the depletion of sulfate and a possible accumulation of sulfide compound, although sulfide is also generally short-lived in shallow ground water and was not analyzed for this study. Lastly, an indication of hydrocarbon degradation linked to carbon dioxide reduction is the accumulation of methane. That process, referred to as methanogenesis, is relatively inefficient and generally

does not result in an observable depletion of carbon dioxide because it is being produced by the more efficient degradation processes (USGS 2005).

Groundwater samples were collected for assessment of NAPs during the 2009 monitoring event at wells at MNA sites for the 5-year review as prescribed by the CMP, Revision 3 (Navy 2007). The samples were tested in the field for DO, ferrous iron, and carbon dioxide and were submitted for laboratory analyses for dissolved methane, alkalinity, and sulfate. During 2009 monitoring, the most consistent geochemical indicators for petroleum degradation observed at contaminated wells were anaerobic conditions (DO concentrations less than 1 milligram per liter [mg/L]); decreased sulfate concentrations; and increased ferrous iron, carbon dioxide, and methane concentrations compared to uncontaminated groundwater. Relatively high measurements of specific conductance were observed in contaminant plumes, but they are not a unique indicator of biodegradation (USGS 2005). For all sites where MNA is the selected remedy, natural attenuation was found to be occurring at some degree in the groundwater. An in-depth discussion of the observance of natural attenuation at individual sites is presented in subsection 3 of Sections 7 through 22.

Evidence for hydrocarbon degradation in groundwater was evaluated by comparing the concentrations of various electron acceptors and end products in “background” groundwater (located upgradient or in nearby uncontaminated areas) to concentrations of the same compounds within and downgradient from a hydrocarbon plume. Background groundwater (well E-701) in the downtown area was observed to be generally aerobic (DO concentrations of around 11 mg/L), with relatively low specific conductance (0.238 milliSiemens per centimeter [mS/cm]), essentially no ferrous iron (less than 0.01 mg/L) or methane (0.0038 mg/L), relatively little sulfate (2.52 mg/L), and low alkalinity (about 18.9 mg/L as calcium carbonate).

One contradictory circumstance for evaluating the indicators of hydrocarbon degradation is that they also are indicative of microbial transformation of non-petroleum organic compounds that may be naturally abundant in certain settings. In a wetland area where the water table is at or near the land surface, for example, the microbial degradation of abundant, naturally occurring organic matter in saturated surface soils results in a geochemical signature that may be indistinguishable from the signature resulting from petroleum hydrocarbon degradation (USGS 2005). Wetlands were specifically observed at SWMU 61, Tank Farm B, where wetland methanogenesis may be occurring.

The next NAPs groundwater sampling is scheduled for 2014. Therefore, 2012 groundwater parameters (DO and ORP) were evaluated for indications of biodegradation and the occurrence of natural attenuation at MNA sites and compared to the 2009 NAPs assessment.

A discussion of these results is presented for the sites for which MNA is the selected remedy in their respective site sections following Section 6.

#### **4.1.3 Visual Inspections**

Visual inspections were performed at each monitoring well gauged and at each surface water and sediment sampling location. Information was recorded on the Monitoring Well and Sampling Visual Inspection Checklists that are presented in Appendix A. As appropriate, the visual inspections at surface water and sediment sampling locations were conducted at low tide in accordance with the CMP, Revision 5 (Navy 2012e). Appendix E of this report includes a summary of wells found in need of repair.

Visual inspections were also performed at shoreline locations at nine sites: the Former Power Plant, Building T-1451 (East Canal); NMCB; SA 78, Old Transportation Building; SA 79, Main Road Pipeline; South of Runway 18-36 Area; SWMU 58/SA 73, Heating Plant 6; SWMU 60, Tank Farm A; SWMU 61, Tank Farm B; and SWMU 62, New Housing Fuel Leak Area (East Canal). Locations of the shoreline visual inspection are presented in Table 4-3 and on sample location figures in specified site sections. Continuous stretches of shorelines were inspected downgradient of the specified sites to detect potential migration of petroleum compounds from contaminated groundwater to adjacent surface water bodies.

Visual petroleum seeps along the shoreline, odor, and sheens on surface waters or sediments were recorded on the Seep and Shoreline Visual Inspection Checklists presented in Appendix A and are summarized in Table 4-3. Visual inspection information from surface water and sediment sample locations are also included in Table 4-3.

The length of East Canal was inspected from the SWMU 62, New Housing Fuel Leak Area product recovery trench to the southern-most point of the canal at the exit culverts that flow into West Canal. This stretch of shoreline encompasses two sites: SWMU 62, New Housing Fuel Leak Area and Former Power Plant, Building T-1451. The two petroleum seeps were observed in East Canal at the SWMU 62 free product recovery trench (booms 2, 3, and 8), and approximately 85 feet further downstream from booms 9/12 (boom 11). The oil-adsorbent booms are being maintained monthly at these locations (2, 3, 8, 9/12, and 11) to control migration of sheen. Oil-stained sediments, pooled free product, petroleum odor, and surface water sheen were observed at these seeps. Remedial activities were performed along the East Canal shoreline at the former seep downgradient of the Former Power Plant, Building T-1451 (boom 9/12), which included removal of petroleum-impacted soil and sediment and replacement with amended clean fill.

**Table 4-3.** 2012 Seep and Shoreline Visual Inspection Results

Site	Water Body	Shoreline Location	Observation <sup>1</sup>			Comments
			Seep	Odor	Sheen or Discolor	
Former Power Plant, Building T-1451	Eastern shoreline of East Canal	From boom 9/12 to south end of East Canal at Crossover Canal	Yes	Yes	Yes	Newly remediated shoreline at boom location 9/12. Small amounts of sheen along remediated shoreline. Petroleum seep at boom 11 is located 75 feet south of boom 9/12 and is approximately 35 feet long. Moderate petroleum odor, oily sediments
			No	Yes	Yes	Surface water/sediment sample NL-08 was collected downgradient of boom 11. Iron staining, petroleum odor, and light sheen noted on water. Sheen noted when sediment was disturbed.
NMCB Expanded Area	Sweeper Cove	Between wells 02-451 and 02-479	No	No	No	No contamination observed.
			No	No	No	Sediment sample NL-05 was collected downgradient of well NMCB-07. No contamination observed.
SA 78, Old Transportation Building	Clam Lagoon	Between wells 12-801 and 12-802	No	No	No	No contamination observed.
SA 79, Main Road Pipeline	Sweeper Cove	From well 02-230 to mouth of South Sweeper Creek	No	No	No	No contamination observed.
South of Runway 18-36 Area	Eastern shoreline of South Sweeper Creek	Between surface water locations NSWSD-07 and NSWSD-08	No	No	Yes	Black-stained sediments (4 ft by 2 ft) were observed just south of the Moffett Road Bridge. Several sections of the shoreline downgradient of the site contained black-stained sediment just beneath the surface which released sheen when disturbed.
			No	Yes	Yes	Sediment sample NSWSD-2. Black sediment with light sheen and moderate petroleum odor.
			No	No	No	Sediment sample NSWSD-4. No contamination observed.
			No	Yes	Yes	Sediment sample NSWSD-5. Black sediment and heavy sheen noted when sediment was disturbed. Heavy petroleum odor.

4-17

**Table 4-3.** 2012 Seep and Shoreline Visual Inspection Results (continued)

Site	Water Body	Shoreline Location	Observation <sup>1</sup>			Comments
			Seep	Odor	Sheen or Discolor	
South of Runway 18-36 Area (continued)	Eastern shoreline of South Sweeper Creek	Between surface water locations NSWSD-07 and NSWSD-08	No	No	No	Surface water sample NSWSD-7. No contamination observed.
			No	No	No	Surface water sample NSWSD-8. No contamination observed.
SWMU 58/SA 73, Heating Plant 6	Unnamed perennial stream	From top of ravine to well 12-804	No	No	No	No contamination observed.
SWMU 60, Tank Farm A	Western shoreline of South Sweeper Creek	Downgradient of well LC5A from mouth of South Sweeper Creek to top of lagoon	Yes	Yes	Yes	Petroleum seep observed near the culvert in Sweeper Creek Lagoon (boom 10). Iron staining, odor, and sheen observed at seep.
			Yes	Yes	Yes	Surface water/sediment sample 852. Moderate odor of petroleum and sheen observed on surface water. Black sediment noted with sheen and heavy petroleum odor when disturbed.
SWMU 61, Tank Farm B	Southern shoreline of North Sweeper Creek	Between avgas pipeline and surface water sample location NL-D-04	No	No	No	No contamination observed.
			No	No	No	Surface water/sediment sample NL-04 collected downgradient of well 14-113. No contamination observed.
			No	No	No	Surface water/sediment sample NL-D-04 collected downstream of NL-04 immediately upstream of confluence of unnamed stream. No contamination observed.
SWMU 62, New Housing Fuel Leak Area	East Canal	Between SWMU 62 free product recovery trench boom locations 8 and 9.	Yes	Yes	Yes	Petroleum seep along shoreline at boom 8 downgradient of product recovery trench approximately 3 feet by 120 feet in length. Sheen, pooled petroleum, black oily sediments, iron staining, stressed vegetation, and strong petroleum odors observed.
			No	Yes	Yes	Surface water/sediment sample NL-09 collected downgradient of boom 8. Moderate petroleum odor and light sheen observed. Light sheen observed when sediment was disturbed.

Note:

<sup>1</sup> Seep, odor, or sheen or discolor was noted for petroleum or other potential site-related contaminants.

As a result, the amount of petroleum seeping at this location has diminished greatly. Only small amounts of sheen were observed during the 2012 LTM activities. A description of each petroleum seep is presented in Table 4-3.

### **East Canal**

Three areas of petroleum seeps are present along the East Canal eastern shoreline at which booms are being maintained to control surface sheen. One large petroleum seep affecting approximately 120 feet of shoreline is located downgradient of the SWMU 62, New Housing Fuel Leak Area free product recovery trench in Eagle Bay Housing. Booms 2, 3, and 8 are maintained monthly at this location. This seep is characterized by oily shoreline sediments and soils, pooled product which periodically collects behind the booms, sheen on surface water, strong petroleum odors, iron staining along the shoreline and in the water, and stressed vegetation where the petroleum flows to the ground surface, all of which were noted during the 2012 shoreline inspection. Periodic free product recovery is currently ongoing in several upgradient wells at the SWMU 62, New Housing Fuel Leak, Eagle Bay site.

The other two seeps are located further south downgradient of Former Power Plant, Building T-1451. Booms 9/12 and 11 are being maintained at that location. Remedial activities were performed at the seep at boom 9/12 in July 2012 as part of the Navy's Petroleum Sites Program. Activities included removal of petroleum-impacted soils and replacement of approximately 100 feet of shoreline with amended clean fill. Since these activities have taken place, the flow of the petroleum seep has markedly decreased. During the shoreline inspection in September 2012, no oily sediments were noted and only light sheen and odor were observed at this location.

One smaller petroleum seep is located approximately 75 feet downgradient of boom 9/12 where boom 11 is being maintained. This seep affects approximately 35 feet of the shoreline of East Canal. Black-stained oily sediments, moderate petroleum odor and sheen were observed at this location during the 2012 inspection. In general, booms are effective in preventing the migration of sheen to downgradient surface waters; this is described in further detail in the Remedial Action Summary Report for Free Product Recovery (Navy 2012f).

Two surface water/sediment samples were collected downgradient of the petroleum seeps in East Canal for analyses of petroleum hydrocarbons to determine the effectiveness of the booms. One sample was collected downgradient of SWMU 62, New Housing Fuel Leak Area boom location 8 (NL-09). The other sample was collected downgradient of Former

Power Plant, Building T-1451 boom location 11 (NL-08). Surface water collected from NL-08 exceeded endpoint criteria for GRO, TAH and TAqH but at concentrations lower than those observed in 2011. DRO was detected in sediment from location NL-08 at lower concentrations than in 2011 but which still exceeded endpoint criteria.

### **South Sweeper Creek**

A shoreline inspection was performed from the mouth of South Sweeper Creek along the western shoreline to the top of Sweeper Creek lagoon. One petroleum seep is located in South Sweeper Creek on the northwestern shoreline of the lagoon downgradient of SWMU 60, Tank Farm A, well LC5A. This seep is characterized by oily sediments, sheen on surface water, heavy petroleum odors, and iron staining which were noted during the shoreline inspection performed in 2012. Boom 10 is maintained at this location to prevent migration of sheen to downgradient surface waters. A surface water/sediment sample was collected at the seep at location 852 and analyzed for petroleum hydrocarbons to determine if natural recovery is progressing. DRO concentrations in surface water at this location fell below endpoint criteria for the first time since 2008. However, DRO concentrations in sediment rose from 1,400 mg/kg in 2011 to 10,000 mg/kg in 2012. Due to the minus tide, the surface water sample was collected approximately 75 feet from the seep where the sediment portion was collected. Periodic free product recovery is currently ongoing in wells 652 and 653 onsite at SWMU 60.

In addition, a shoreline inspection was performed on the opposite (eastern) shoreline of South Sweeper Creek from the mouth of the creek to South of Runway 18-36 surface water location NSWSD-08. Oily sediments have been historically observed on the eastern shoreline of South Sweeper Creek downgradient from the South of Runway 18-36 product recovery trench. These oily sediments are approximately a quarter to a half inch below ground surface (bgs) and are not associated with an active petroleum seep. Oil-adsorbent boom 6 is being maintained monthly in South Sweeper Creek to control migration of sheen from this site and from SWMU 60 to Sweeper Cove (see the Remedial Action Summary Report for Free Product Recovery [Navy 2012f] for more details).

During the shoreline inspection, one small area of black-stained sediment (4 ft by 2 ft) was observed just south of the Moffett Road Bridge. Several sections of the shoreline downgradient of the site contained black-stained sediment just beneath the soil surface which released sheen when disturbed. Oily sediments, petroleum sheen, and odor were observed along the shoreline adjacent to South of Runway 18-36 during sediment sampling at locations NSWSD-2 and NSWSD-05 at approximately a quarter to a half inch below the

sediment surface. For the first time since sampling commenced at this location, no visible petroleum contamination was observed at NSWSD-4. However, DRO concentrations in all three of these sediment samples still exceeded endpoint criteria in 2012. No visible contamination was observed at either surface water sample NSWSD-07, collected at the mouth of South Sweeper Creek, or NSWSD-08, collected north and upstream of the site. Neither sample exceeded any endpoint criteria.

### **Sweeper Cove**

No visual evidence of petroleum contamination was observed during the Sweeper Cove shoreline inspection at the NMCB Expanded Area downgradient of well NMCB-07. Sediment sample NL-05 was collected at this location for analyses of DRO, GRO, and benzene. None of these contaminants exceeded endpoint criteria in 2012. Monthly product recovery is being performed at this site (see Appendix J).

A shoreline inspection of Sweeper Cove was performed at site SA 79, Main Road Pipeline from well 02-230 to the mouth of South Sweeper Creek. This inspection was performed because groundwater has historically exceeded endpoint criteria in surface water protection in wells 02-230 and MRP-MW8. No evidence of petroleum contamination was observed during the inspection.

### **Clam Lagoon**

A shoreline inspection was performed at SWMU 58/SA 73, Heating Plant 6 of the on-site perennial stream from the top of the ravine to downgradient of well 12-804. This stream flows into Clam Lagoon but during the inspection had no free-flowing water. This inspection was performed because 0.01 feet of free product was observed in surface water protection well 12-601 in 2009. No evidence of petroleum contamination was observed during this inspection. Monthly product recovery ceased at this site in 2012 as per the 2012 Annual Groundwater Monitoring Report (Navy 2012c) recommendations.

A shoreline inspection was performed at SA 78, Old Transportation Building of the Clam Lagoon shoreline between wells 12-801 and 12-802. This stream flows into Clam Lagoon but during the inspection had no free-flowing water. This inspection was performed because free product was observed in surface water protection well 12-802 in 2009. No evidence of petroleum contamination was observed during this inspection; therefore, surface water and sediment sample NL-10 was not collected per the CMP, Revision 5 (Navy 2012e).

## **North Sweeper Creek**

A shoreline inspection of North Sweeper Creek was performed in 2012 downgradient of site SWMU 61, Tank Farm B between monitoring well 14-113 and the confluence with an unnamed stream approximately 100 feet to the north. No visual evidence of petroleum contamination was observed during the inspection or during sampling at locations NL-04 and NL-D-04. No surface water exceeded endpoint criteria. No target analytes were detected in the sediment collected at NL-04 and NL-D-04, although the GRO detection limits were elevated due to the high moisture content of the sample.

Shoreline inspections are also discussed in the respective site sections following Section 6.

### **4.1.4 Environmental Sampling**

Groundwater samples were collected from 83 monitoring wells during the sampling event. Surface water was collected from seven locations, and sediment samples were collected from nine locations. All samples were collected in accordance with the CMP, Revision 5 (Navy 2012e).

The purpose of monitoring at each well location is specified in Table 2-6. Samples were collected using low-flow sampling methods as outlined in NAVFAC SOP I-C-5 (Low-Flow Groundwater Purging and Sampling) and Stand-Alone Specific Instruction #4 (Low-Flow Groundwater Sampling from Shallow Wells). Well purging and sampling were conducted using a low-flow peristaltic pump. Wells were considered adequately purged when field parameters (pH, ORP, specific conductance, turbidity, DO, temperature, and salinity) stabilized or when a minimum of three well casing volumes had been removed.

An interface probe was used to monitor the presence or absence of free product at each well sampling location before the sample collection activities were initiated. Product thickness and depth-to-groundwater were measured relative to the survey mark on the top of the well casing. If free product was measured at a thickness greater than or equal to 0.02 feet in a monitoring well scheduled for groundwater sampling, no sample was collected. Such deviations were documented on Sampling Deviation Forms (Appendix B). Free product was removed from monitoring wells if measured at greater than 0.5 feet in a 2-inch-diameter well or greater than 0.1 feet in a 4-inch-diameter (or larger) well. During the 2012 LTM event no product was observed exceeding these thicknesses. The majority of site wells that were monitored were 2 inches in diameter. Deviations from planned sampling and field activities are discussed in greater detail in Section 5.

#### **4.1.5 Sample Preservation and Volume Requirements**

To maintain the integrity of the samples from the time they were collected until the analyses were completed, the samples were preserved by chemical addition, cooling, or both at the time of collection. This process served to prevent or retard the degradation or modification of chemicals in samples.

The sample container type and volume required for each analysis are specified in the CMP, Revision 5 (Navy 2012e) and in the revised CMP Appendix A and B tables (Navy 2012b).

#### **4.1.6 Sample Custody and Holding Time Requirements**

All samples submitted to the laboratory were labeled as specified in NAVFAC SOP III-E (Record Keeping, Sample Labeling, and Chain-of-Custody Procedures). Sample custody was documented by recording the sample handling history from the time a sample was collected, through all transfers of custody, until it was received at the analytical laboratory, as specified in NAVFAC SOP III-E. After collection, identification, and preservation, the samples were maintained following the specified custody procedures through delivery to and analysis by the contract laboratory. Internal laboratory records then documented the custody of the sample through final disposition.

To ensure the samples collected during site investigations were traceable from the time they were collected until their derived data were used in the final report, the following sample handling and chain-of-custody procedures were used:

- Sampling information was recorded in field logbooks and field data forms. This information included identifying information, such as project code, sample identification names, sample location, date, time, name of samplers, field observations, and remarks.
- Samples were collected per applicable Navy SOPs. Containers were batched in lots together with documentation to indicate their integrity. Field personnel were responsible for the care and custody of the samples collected until they were properly transferred or dispatched to the laboratory.

The information recorded on the sample label included the following, as appropriate: project name, field sample name, sample location, date, time, chemical analysis, preservation, sampler's initials, and media.

Samples were packaged according to U.S. Department of Transportation (DOT) sample preservation requirements for shipment and then dispatched to the laboratory for analysis with a chain-of-custody record accompanying each shipment. Field personnel kept a duplicate copy of the chain-of-custody record. Each individual sample container or group of sample containers were sealed with custody tape, and placed in a cooler. Empty space within the cooler was filled with bubble pack or other material to prevent shifting or breakage during shipment. Sufficient “gel ice” was added to maintain required temperatures, accounting for expected shipping and transfer times. Chain-of-custody forms were enclosed in sealed waterproof plastic bags in each cooler, which was then sealed with custody tape. The sampler or designated sample packager initialed and dated the seals. Because of airline inspections that break the cooler seals, sample containers (or groups of sample containers) were individually wrapped to maintain the security of the samples. All samples shipped to a laboratory were shipped by the most expeditious means (e.g., the next off-island flight). Preservation, shipping, and holding times were coordinated with flights to meet the method-specific requirements.

Upon receipt at the laboratory, cooler temperatures were within the acceptance range of 2°C to 6°C or slightly lower. Some temperatures were below 2°C; however, data quality is not adversely impacted by temperatures below 2°C. A few sample containers did freeze and break due to low temperatures, but sufficient unbroken containers were available to perform the required analyses (extra sample containers were provided to the laboratory in case of breakage during shipping). Thus, no required sample analyses were lost due to breakage or temperature exceedance.

Samples were prepared and analyzed within holding times, with three exceptions. The samples collected from wells 14-113, MRP-MW2, and MRP-MW3 were analyzed one or two days past the 14-day holding time for BTEX. However, the missed hold times did not appear to affect sample results which were consistent with previous analytical data. These samples are scheduled to be collected again in 2013. The holding time exceedances were assessed during third-party data validation and discussed in the applicable data validation reports provided in Appendix F. The reported data for the sample were qualified as estimated and deemed acceptable by the third-party data validation firm, Laboratory Data Consultants (located in Carlsbad, California). All other samples were prepared and analyzed within holding times.

## **4.2 ANALYTICAL METHODS**

The laboratory analyses were performed in accordance with applicable EPA or Alaska approved methods. Routine procedures used for measuring precision and accuracy include analyses of quality control (QC) samples including field duplicate samples, matrix spike/matrix spike duplicate (MS/MSD) sets, and method blanks. Laboratory QC checks were the responsibility of the contracted laboratory. Environmental and QC samples collected during the field program were sent to Columbia Analytical Services in Kelso, Washington for quantitative analyses. A summary of chemical analyses used by sample location is presented in Table 4-2.

To achieve compliance sampling requirements at some sites, TAH and TAqH analyses were performed as specified in the CMP, Revision 5 (Navy 2012e). Calculation of TAH included the analysis of BTEX by EPA Method 8260C and summing the results. When one or more compounds were detected, TAH was calculated by summing the detections (the number zero was used for undetected compounds). When no detections for BTEX were reported, TAH was calculated by summing the detection limits. Calculation of TAqH included analysis of 16 PAHs by EPA Method 8270D Selected Ion Monitoring (SIM) and BTEX by EPA Method 8260C. The sum of these results was used to calculate the TAqH results reported. When one or more compounds were detected, TAqH was calculated by summing the detections (the number zero was used for undetected compounds). When no detections for individual compounds were reported, TAqH was calculated by summing the detection limits.

## **4.3 INVESTIGATION-DERIVED WASTE**

IDW generated during the field investigation (e.g., equipment-decontamination fluids, well purge water, and miscellaneous wastes) was handled according to the Final Waste Management Plan (Navy 2012d). Approximately 15 gallons of non-regulated purge water (from non-CERCLA sites) was filtered through a granulated activated carbon filter and was sampled (sample IDW-PETRO-2012) for toxicity characteristic leaching procedure (TCLP) compounds and petroleum site contaminants of concern. Similarly, approximately 5 gallons of purge water from non-landfill CERCLA sites was filtered through a granulated activated carbon filter and sampled (sample IDW-CERCLA-2012) for TCLP compounds and non-landfill CERCLA site contaminants of concern. All IDW purge water was stored in properly labeled 55-gallon drums within secondary containment at the storage bunker as per the Final Waste Management Plan (Navy 2012d), pending analysis and disposal.

Analytical results from samples IDW-PETRO-2012 and IDW-CERCLA-2012 (included in Appendix F) showed that all contaminants of concern were below hazardous waste criteria and endpoint criteria for no unacceptable risk sites (10 times cleanup criteria). The purge water was then discharged to the ground at CERCLA/petroleum site SWMU 17, Power Plant No. 3 Area as per the Final Waste Management Plan (Navy 2012d).

## 5. DEVIATIONS

Based on the requirements of the CMP, Revision 5 (Navy 2012e) and the revised CMP Appendix A and B tables (Navy 2012b), the following deviations occurred during the 2012 monitoring event. Sampling Deviation Forms are provided in Appendix B.

Because of the presence of free product in the well greater than 0.02 feet in thickness, the following four monitoring wells were not sampled as scheduled:

- NMCB Building T-1416, wells 02-818, NMCB-07, and NMCB-10
- SWMU 58/SA 73, Heating Plant 6, well 12-121

At Former Power Plant, Building T-1451, well 01-151 had been removed during remediation activities conducted by the Navy Petroleum Sites Program in July 2012 and therefore, sampling was not performed. This well had been located at the shoreline of East Canal downgradient from the site.

Surface water/sediment sample NL-10 was not collected along the shoreline of Clam Lagoon downgradient of the SA 78, Old Transportation Building site because no petroleum contamination was observed during the shoreline inspection.

One Field Change Request was submitted to amend the Waste Management Plan (Navy 2012d) which was approved by the Navy. Since the only metal of concern for the CERCLA sites was lead, it was not necessary to analyze the drummed purge water from these sites for aluminum and the other 12 priority pollutant metals as prescribed in the plan for waste characterization. Therefore, the metals analysis of this sample was reduced to total lead only.

Groundwater monitoring activities were not performed at SWMU 25, Roberts Landfill as per the recommendations in the 2011 Landfill Monitoring Report. Surface water monitoring also was not performed at SWMU 25, Roberts Landfill due to a misunderstanding in monitoring frequency between the Navy and ADEC. Both groundwater and surface water monitoring at SWMU 25 will be performed in 2013 as prescribed in the CMP, Revision 5.

## **6. DATA QUALITY ASSESSMENT**

This section evaluates the quality of laboratory and field data. Data quality goals are specified in the CMP, Revision 5 (Navy 2012e) and the revised CMP tables (Navy 2012b). Evaluation of field effort compliance with data quality goals was accomplished by assessing the precision, accuracy, and completeness of the field effort and the comparability and representativeness of the data. Data quality goals were met for the 2012 monitoring event and are discussed in the following subsections.

### **6.1 QUALITY ASSURANCE/QUALITY CONTROL**

Quality assurance (QA) and QC activities were implemented throughout the planning, implementation, assessment, and reporting processes to ensure that environmental data of known and acceptable quality were provided to meet the requirements and objectives of the CMP. These activities are defined as follows:

- QA – An integrated system of management activities involving planning, implementation, assessment, reporting, and improvement to ensure that an item, process, or service is of the type and quality needed. This system includes development of plans, training of personnel, implementation of applicable procedures, documentation of field and analytical processes, and assessment of final products by independent objective sources.
- QC – An overall system of technical activities that measures the performance of a process, item, or service against defined standards to verify that performance meets the stated requirements. This system includes field measurement, field and laboratory QC samples, and third-party review.

#### **6.1.1 Quality Assurance**

The following QA activities were performed to ensure project requirements were met:

- Current and applicable plans and procedures were available and used by field personnel.
- Project personnel received adequate indoctrination and training on procedures and protocols for sample collection, chain-of-custody process, sample shipment, laboratory analysis, data review, and final reporting.

- All activities, findings, and results were documented, defensible, and consistent with the data quality requirements.
- Changes to contractual or CMP requirements followed project procedures, with significant changes to be noted in the final document, and with appropriate justification and assessment of the potential or real impacts on the results.

Level 4, third-party validation was performed by Laboratory Data Consultants in Carlsbad, California on the analytical data packages associated with LTM samples generated by the laboratory. The validation was performed to verify that data quality was acceptable. Data Validation Reports, including qualified sample results, are presented in Appendix F. The requirement for an additional Laboratory Data Review Checklist was waived by ADEC for LTM data for this project.

For waste characterization samples, the data generated by the laboratory was reviewed by Laboratory Data Consultants. Laboratory Data Review Checklists were completed and are provided in Appendix F.

### **6.1.2 Quality Control**

The following QC activities were performed to ensure data were usable and defensible for the intended use:

- Field measurements (parameters) were used to ensure that appropriate groundwater samples were obtained.
- Field QC samples were collected at the appropriate frequency to ensure field procedures were properly performed and to determine field and laboratory conditions that could influence data quality including trip blanks, field duplicates, and MS/MSDs.
- Review of documentation was performed for accuracy and completeness of records.
- Laboratory QC samples were used to measure analytical data quality.

### **6.1.3 Field Quality Control Samples**

QC samples are necessary for evaluating the field precision, accuracy, representativeness, and comparability of the data. The three types of QC samples analyzed for this project were field duplicates, trip blanks, and MS/MSDs. Each field duplicate and MS/MSD was collected in the field at the same time the environmental sample was collected. The analytical laboratory provided the trip blanks.

For every 20 samples taken, one duplicate sample was collected and submitted for laboratory analysis. The duplicate samples were intended to be identical to the original sample and are used to gain field precision information on homogeneity, handling, shipping, storage, preparation, and analysis. Duplicate sampling was used to identify possible field and laboratory variations or errors. Each duplicate sample was collected at the same time and location as the corresponding environmental sample.

For every 20 samples taken, one MS/MSD triple-volume sample was collected and submitted to the laboratory. The MS/MSD samples were used to evaluate analysis bias or interferences that may have occurred due to the sample matrix.

Water trip blanks were prepared by the laboratory with analyte-free water and accompanied groundwater and surface water sample aliquots designated for volatile constituents during storage and shipment back to the laboratory. Sediment trip blanks were prepared with methanol and accompanied sediment samples for volatile constituents during storage and shipment back to the laboratory. One trip blank accompanied each cooler containing samples submitted for GRO, VOC, and BTEX analyses. Trip blanks are used to assess possible sources of erroneous contamination from packing, shipping, and storage.

The CMP, Revision 5 (Navy 2012e) specifies that field duplicates and MS/MSDs be collected at a rate of 1 for every 20 environmental samples (5 percent). Field duplicate and MS/MSD samples were collected for every analytical parameter at a rate equal to or greater than 1 for every 20 environmental samples (greater than 5 percent), which met the specified objective of 5 percent. All field duplicate and MS/MSD samples that were collected were analyzed as requested.

## **6.2 PRECISION**

Precision is a measure of the agreement among replicate, duplicate, or collocated sample measurements of the same analyte. The closer the numerical values of the measurement are to each other, the more precise the measurement. Precision examines the spread of data about the mean. The spread shows how different the individual reported values are from the average reported value. Precision is a measure of the magnitude of errors and is expressed as relative percent difference (RPD). Therefore, the lower the RPD value, the more precise the data.

RPD is calculated as follows:

$$\text{RPD} = \frac{(\text{SR} - \text{DS})}{[(\text{SR} + \text{DS}) / 2]} \times 100$$

Where: SR – sample result  
DS – duplicate sample result

The project objective for precision was to meet requirements specified in the CMP and analytical methods. Precision was evaluated during third-party data validation by examining results for field duplicate sets, MS/MSD sets, sample/matrix duplicate results, and laboratory control sample/laboratory control sample duplicate sets.

Precision was assessed during the independent data validation. Data validation reports are provided in Appendix F. The overall precision of the data for this project was determined to have met the acceptance criteria.

The RPD values for environmental samples and field duplicate samples are also used to evaluate the precision of the field sampling program. In this case, the RPD values were calculated for those analyte pairs (primary and duplicate) for which results were detected. If one or both of the analyte pair results were qualified as not detected (U), then an RPD was not calculated for that particular analyte.

The field duplicate results for the groundwater and surface water samples are provided in Appendix G, Table G-1; the field duplicate results for sediment samples are provided in Appendix G, Table G 2. The RPD values for detected analytes are also summarized in these tables and compared to the criteria of 50 percent specified in the CMP, Revision 5 (Navy 2012e). As shown in Tables G-1 and G-2 of Appendix G, the RPD values for six paired data points for the field duplicate sets were greater than the criteria. For the remaining 61 paired data points summarized in the two tables, no RPD exceedances were observed. Assessment of the field duplicate results indicates that the overall field sampling program has met the requirement for precision.

### 6.3 ACCURACY

Accuracy is a measure of bias in a measurement system that indicates the average or systematic error of an analytical method. Examples of bias include contamination and errors made in sample collection, preservation, handling, or analysis. Accuracy is also assessed by the collection of trip blanks and by the use of known and unknown QC samples. The more closely the value of the measurement agrees with the true value, the more accurate the

measurement. Accuracy is expressed as the percent recovery (PR) of an analyte such as a surrogate, blank spike (or laboratory control sample), or matrix spike. Sample surrogate, blank spike, and matrix spike recoveries are calculated by the laboratory and reported on standard forms for comparison. The closer the value is to 100 percent, the more accurate the data.

Accuracy for QC samples is often measured as PR, which is calculated as follows:

$$PR = \frac{SSR - SR}{SAA} \times 100$$

Where: SSR – spike sample result  
SR – sample (unspiked) result  
SAA – spike amount added

The project objective for accuracy is to meet requirements specified in the CMP and analytical methods.

Accuracy was evaluated during third-party data validation by examining PR for matrix spikes, laboratory control samples, and surrogate compounds as well as by reviewing sample receipt conditions and items such as results for trip and method blanks. A small percentage of the 2012 analytical results were qualified as “estimated” or “not detected” because of exceedances of accuracy criteria, such as recoveries outside the specified criteria, or trace contamination observed in the trip and method blanks; however, the overall effect on the accuracy goals for the entire sampling event was negligible. The overall accuracy of the data for this project was determined to have met the acceptance criteria specified in the CMP and analytical methods.

## 6.4 COMPLETENESS

Completeness is a comparison of the number of valid measurements obtained relative to the total number of measurements planned. The closer the numbers, the more complete the measurement process. The completeness goal for the project is greater than 95 percent.

Analytical completeness is a comparison of the number of valid (usable) measurements obtained relative to the total number of planned measurements. During 2012, data for samples that were collected and submitted for laboratory analysis were validated by a third-party validation firm. Several samples were analyzed more than once for a particular analyte. In these cases, the validation firm selected a preferable result and rejected the less preferable result. A usable result for each analyte was obtained for each sample during this process. Therefore, analytical completeness for the project was 100 percent.

Overall completeness can be influenced by factors such as ability to collect a valid sample or environmental conditions (e.g., presence or absence of free product). During the 2012 monitoring event, four wells were not sampled because of the presence of floating free product. The CMP specifies that groundwater samples not be collected from wells where free product is observed on the groundwater surface at a thickness of 0.02 feet or greater. A second factor impacting overall completeness was identified for surface water and sediment. At one location, NL-10 at SA 78, Old Transportation Building, no surface water or sediment samples was collected because contamination was not observed. Finally, groundwater could not be collected at well 01-151 at Former Power Plant, Building T-1451 because the well had been removed during remedial activities in July 2012.

Overall completeness for the 2012 groundwater sampling program for each analytical method per site is summarized in Appendix G, Table G-3. Completeness for some parameters for some sites was less than the project-specific QC goal of 95 percent. However, usable information (i.e., whether free product in a well was present or absent, or whether visual contamination at a surface water and sediment location was present or absent) was obtained at five locations that were not sampled. Thus, completeness did not impact data quality.

Per the data validation reports (Appendix F), the 2012 data met the quality goals established in the CMP, Revision 5 (Navy 2012e) and the revised CMP tables (Navy 2012b). These data (as qualified) are usable for monitoring purposes.

## **6.5 COMPARABILITY**

Comparability is a qualitative parameter that expresses the confidence with which one data set can be compared to another. The comparability goal is achieved by using SOPs to collect and analyze representative samples, report analytical results in appropriate and consistent units, and establish consistent reporting limits. The goal is also achieved by maintaining consistency in sampling conditions, selection of sampling procedures, sample preservation, and analytical methods. Complete documentation on field data collection supports the assessment of comparability. Historical comparability is achieved through consistent use of methods and documentation procedures throughout the project.

Planned sample collection and handling techniques were consistently used to maintain comparable representativeness of all collected samples. Consistent sampling procedures and analytical methods were used. Consistent sample preservation techniques were used to the maximum extent practicable. Laboratory-reported analytical results were provided in

appropriate and consistent units with the appropriate method detection limit and reporting limit (also referred to as a quantitation limit). The detection limits provided by the laboratory met the goal to be less than the specified endpoint criteria, with two exceptions. The exceptions were the GRO detection limits for the sediment samples collected at locations NL-04 and NL-D-04 at SWMU 61, Tank Farm B, which were greater than the endpoint criteria due to high water content in the samples.

## **6.6 REPRESENTATIVENESS**

Representativeness is a qualitative parameter that expresses the degree to which sample data accurately and precisely represent a characteristic of a population, parameter variations at a sampling point, or an environmental condition. The design and rationale of the sampling program, which ensured that environmental conditions were sufficiently represented, included the purpose of sampling, selection of sampling locations, number of samples to be collected, ambient conditions for sample collection, frequencies and timing of sampling, and sampling techniques. Sampling locations were selected to represent the range of environmental conditions observed. An adequate number of samples were collected during the 2012 LTM field event.

The representativeness of data generated for this project was evaluated by performing Level 4 validations. Representativeness was evaluated, in part, by examining the chain-of-custody paperwork and verifying that the sample analyses were performed within the specified holding time. No custody issues were identified during data validation. With the exception of three samples for BTEX (as discussed in Section 4.1.6), all samples were analyzed within the applicable holding times. As indicated in the validation reports provided in Appendix F, all data were found to be acceptable, as qualified, and the quality goals for representativeness were considered to be met.

## **7. FORMER POWER PLANT, BUILDING T-1451**

This section presents the results of groundwater monitoring performed at the Former Power Plant, Building T-1451 site during 2012. MNA is the remedy selected for this site (Navy et al. 2000). To comply with requirements specified for this remedy, the Navy conducts periodic groundwater sampling and water level/product thickness monitoring. Groundwater samples are collected from these wells to evaluate groundwater quality relative to Alaska groundwater cleanup levels (18 AAC 75.345), to verify that natural attenuation is occurring, and to monitor for surface water protection.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, a discussion of natural attenuation conditions, an interpretation of groundwater flow direction based on groundwater levels, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, trend evaluation analyses for historical target analyte concentration data, conclusions based on these analyses, and recommendations for future monitoring activities at the site.

### **7.1 FIELD MEASUREMENTS**

Depth-to-water and product thickness measurements were collected at three monitoring wells on September 1, 2012. Table 7-1 provides the measured depths to water, calculated groundwater elevations, and if present product thicknesses. Figure 7-1 shows the location of the monitoring wells relative to potential source areas at the Former Power Plant site, the site topography, approximate groundwater flow direction, and the downgradient surface water body (East Canal of the airport ditch system). The historic water level data indicate that the direction of groundwater flow is to the west, toward East Canal.

Two monitoring wells were sampled on September 1, 2012. Surface water protection monitoring well 01-151 was not sampled as planned because it had been removed during the remediation activities conducted in July 2012 under the Navy's Petroleum Sites Program. Field measurements were recorded on the field forms and logbooks during monitoring well sampling activities (Appendix A). Table 7-1 lists the final field measurements recorded at each monitoring well prior to sample collection. A review of the sampling data reported for this site indicates that groundwater parameters stabilized at both monitoring wells. Free product was not observed in either well during the annual 2012 LTM field event.

**Table 7-1.** 2012 Field Measurements for Former Power Plant, Building T-1451

Well Location	Physical Measurements				Groundwater Parameters						
	Casing Elevation (ft MLLW)	Depth to Water (ft BTOC)	Groundwater Surface Elevation (ft MLLW)	Measured Product Thickness (ft)	pH (SU)	Specific Conductance (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Temperature (°C)	Salinity (%)	ORP (mV)
<b>Groundwater Samples</b>											
01-118	19.68	16.62	3.06	0	6.29	0.650	106.0	0.00	6.48	0.0	-60

01-151	Well removed during July 2012 petroleum sites remediation activities.										
<b>Surface Water Sample</b>											
NL-08	NA	NA	NA	NA	6.59	0.840	11	9.44	13.90	0.0	-41

*Notes:*  
 The reported casing elevation is the surveyed elevation residing in the NIRIS database.  
 The last groundwater parameter measurement prior to sample collection is reported.

The eastern shoreline of East Canal was inspected from the former location of well 01-151 to the southern-most point of the canal at the exit culvert (Crossover Canal) that flows into West Canal (Figure 7-1). Two petroleum shoreline seeps are located in East Canal downgradient of the Former Power Plant site. Adsorbent booms (boom locations 9/12 and 11) have been placed at the seeps to prevent the migration of sheen downstream and are maintained monthly. Free product recovery operation and maintenance activities are summarized in the Remedial Action Summary Report, Free Product Recovery, Adak (Navy 2012f).

In July 2012, the Navy conducted remedial activities at this site as part of the Navy's Petroleum Sites Program. Activities included removal of petroleum-impacted soils and replacement of approximately 100 feet of East Canal shoreline with amended clean fill. As a result, the flow of the petroleum seep located at boom 9/12 has markedly decreased. During the shoreline inspection in September 2012, no oily sediments were noted and only light sheen and odor were observed at this location.

One smaller petroleum seep is located approximately 75 feet downgradient of boom 9/12 where boom 11 is being maintained. This seep affects approximately 35 feet of the shoreline of East Canal. Black-stained oily sediments, moderate petroleum odor and sheen were observed at this location during the 2012 inspections. In general, booms are effective in preventing the migration of sheen to downgradient surface waters; this is described in further detail in the Remedial Action Summary Report for Free Product Recovery (Navy 2012f).

One surface water and sediment sample (NL-08) was collected downgradient of the southern-most boom (boom 11) to determine the effectiveness of adsorbent booms (Figure 7-1). Iron staining, petroleum odor, and light sheen were noted on the surface water. Petroleum sheen was observed when the sediment was disturbed during sampling. Results of shoreline inspections are summarized in Section 4.1.3.

## **7.2 TARGET ANALYTE RESULTS**

The groundwater samples collected from monitoring wells 01-118 and 01-150 were analyzed for DRO. Monitoring wells 01-118 and 01-150 are located within a dissolved petroleum plume and downgradient of the former petroleum-release area but upgradient from East Canal.

One surface water sample and one sediment sample were collected downgradient of the southern-most boom (boom 11) at location NL-08. Surface water was analyzed for DRO, BTEX, and PAHs for the calculation of TAH and TAqH. Sediment was analyzed for DRO and PAHs. Because no risk-based endpoint criteria have been established for East Canal, DRO results were compared to the criteria established for South Sweeper Creek which may or may not reflect risks associated with East Canal.

Figure 7-1 shows the locations of the sampling locations and the analytical results that exceed the applicable endpoint criteria. Table 7-2 presents groundwater results for the 2004 through 2012 events. Tables 7-3 and 7-4 present the surface water and sediment analytical results, respectively. The analytical results obtained for these locations from 1999 through 2012 are summarized in Appendix C. Laboratory reports presenting the 2012 results are provided in Appendix F.

**Table 7-2.** Analytical Results for Petroleum-Related Chemicals at Former Power Plant, Building T-1451

<b>Well Location</b>	<b>Year</b>	<b>DRO (µg/L)</b>
01-118 Plume Source Area	2004	<b>7,080</b>
	2005	<b>11,200 J</b>
	2006	<b>8,700</b>

	2011	1,400 Y
	2012	1,300 YJ
<b>Endpoint Criteria</b>		<b>1,500</b>
<i>Notes:</i>		
<b>Bold</b> indicates reported concentration is greater than the endpoint criteria or water quality standard.		

**Table 7-3.** Analytical Results for Surface Water at Former Power Plant, Building T-1451

Location	Year	DRO (µg/L)	Indeno(1,2,3-cd)pyrene (µg/L)	TAH <sup>1</sup> (µg/L)	TAqH <sup>2</sup> (µg/L)
NL-08	2010	240 Y	0.020 U	6.2 J	6.2 J
	2011	130 Y	0.020 U	7.4 J	7.5 J
	2012	160 YJ	0.020 U	3.4 J	3.4 J
Endpoint Criteria <sup>3,4</sup>		250	0.28	10	15

*Notes:*

<sup>1</sup> TAH results were calculated by summing the detected concentrations of BTEX when one or more were detected and by summing the reporting limits when none were detected.

<sup>2</sup> TAqH were calculated by summing the detections of BTEX and 16 PAHs when one or more were detected and by summing the reporting limits when none were detected.

<sup>3</sup> The TAH and TAqH endpoint criteria are based on ADEC water quality standards as specified in 18 AAC 70.

<sup>4</sup> Endpoint criteria for East Canal have not been established, so endpoints for South Sweeper Creek were used.

**Table 7-4.** Analytical Results for Sediment at Former Power Plant, Building T-1451

Location	Year	DRO (mg/kg)	2-Methylnaphthalene (mg/kg)	Phenanthrene (mg/kg)
NL-08	2010	51 Y	0.0031 U	0.0031 U
	2011	<b>420 DY</b>	0.0040 U	0.029
	2012	<b>170 DY</b>	0.0050 U	0.0030 J
Endpoint Criteria <sup>1</sup>		90.6	0.0202	0.225

*Notes:*

<sup>1</sup> Endpoint criteria for East Canal have not been established so endpoints for South Sweeper Creek were used.

**Bold** indicates reported concentration is greater than the endpoint criteria.

DRO was detected above the endpoint criteria of 1,500 µg/L in groundwater collected from wells 01-118 (9,400 µg/L) but below the endpoint criteria in well 01-150 (1,300 µg/L).

Concentrations of DRO, TAH, and TAqH were detected in the surface water sample collected at location NL-08 below endpoint criteria (250 µg/L, 10 µg/L, and 15 µg/L, respectively). Indeno(1,2,3-cd)pyrene was not detected in the surface water sample.

DRO was detected in sediment sample NL-08 at 170 mg/kg, which was greater than the endpoint criteria of 90.6 mg/kg. No other compound was detected in this sample above endpoint criteria.

### 7.3 MONITORED NATURAL ATTENUATION

NAPs were collected at this site in 2009 to determine whether natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data indicated that biodegradation of petroleum hydrocarbons is likely occurring by iron (II) reduction; sulfate reduction; and methanogenesis as shown by elevated ferric iron concentrations, depleted sulfates, and elevated methane concentrations in comparison to background

conditions. Groundwater parameters collected during the 2012 LTM event, which are presented in Table 7-1, provide evidence of continued natural attenuation as shown by the reducing environment (negative ORP) and depleted dissolved oxygen (0.0 mg). A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

#### **7.4 TREND EVALUATION**

Statistical trend evaluations were conducted for target analyte concentrations in groundwater in accordance with the CMP, Revision 5 (Navy 2012e). Trend evaluation was conducted for only analytes that exceeded the endpoint criteria within the last two sampling events and had a minimum of four data points. Sen's slope was calculated only when decreasing trends were observed. Results of the statistical evaluations are summarized in Table 7-5.

Worksheets and graphs are provided in Appendix H.

The following are the results of the statistical evaluation:

- Well 01-118: DRO in this well exhibits stable values with no trend at the 80 and 95 percent confidence intervals.

#### **7.5 CONCLUSIONS**

This section presents the conclusions based on a review of groundwater monitoring performed at the Former Power Plant, Building T-1451 site in 2012. The conclusions are as follows:

- Groundwater Flow: Based on the water levels measured in 2012, the approximate groundwater flow direction at the site is to the west, toward East Canal.
- MNA: The groundwater parameters obtained during the 2012 LTM event provide evidence that natural attenuation of petroleum hydrocarbons continues to occur at the site.
- No free product was detected in either well at this site in 2012.
- Well 01-118: The DRO concentration has remained above the endpoint criteria established for groundwater used as a drinking water source (1,500 µg/L) for the last nine monitoring events. The Mann-Kendall trend evaluation performed on the DRO data collected between 2002 and 2012 did not exhibit a trend at the 80 or 95 percent confidence intervals.
- Well 01-150: The DRO concentration exceeded endpoint criteria in 2008 but has been below the endpoint criteria for the last four years.

- Well 01-151: This well was removed during the Navy's remedial activities in July 2012; therefore, sampling was not performed.
- A shoreline inspection was conducted downgradient of this site on the eastern bank of East Canal, between the former location of well 01-151 and the southern-most end of the canal. Oily sediments, pooled product, surface water sheen, and petroleum odor were observed along the shoreline at boom location 11 (see Section 4.1.3). The previously documented petroleum seep at boom 9/12 has undergone remediation and oily shoreline soils have been replaced with amended clean fill. Only small amounts of sheen and a light petroleum odor were observed to remain at this location in 2012.
- Sampling location NL-08: Surface water and sediment samples were collected downgradient of the southern-most boom (boom 11) in East Canal to determine whether the installed booms were effectively preventing the migration of petroleum contamination. The surface water collected from this location did not exceed endpoint criteria in 2012. However, DRO was detected in the sediment at 170 mg/kg, which was greater than the endpoint criteria of 90.6 mg/kg. No active petroleum seep was observed at this sampling location, but odor and sheen were observed when sediment was disturbed during sampling.

## 7.6 RECOMMENDATIONS

DRO concentrations remain above the endpoint criteria in the groundwater sample collected from well 01-118; therefore, monitoring should continue at this site as prescribed in the CMP, Revision 5 (Navy 2012e). DRO concentrations have been observed below endpoint criteria in well 01-150 for the last four sampling events. However, it is recommended that monitoring continue at this well because it is located downgradient of the source plume. Because an oil seep is located downgradient of this site in East Canal, shoreline inspections of East Canal should continue to be conducted annually. The newly replaced shoreline should also continue to be monitored and boom 9/12 maintained to ensure the treatment remains effective. Also, surface water (analyzed for DRO, TAH, and TAqH) and sediment sampling (analyzed for DRO and PAHs) should continue in East Canal downstream of boom 11 (location NL-08) as prescribed in the CMP, Revision 5 (Navy 2012e).

The wells newly installed at this site during the summer of 2012 are recommended to be added to the monitoring program. Because remedial actions occurred at this site in 2012, it is recommended that all monitoring at this site be continued as prescribed for one more year and that reduction of monitoring to every odd year be re-evaluated based on 2013 results.

**Table 7-5.** Concentration Trend Evaluation for Former Power Plant, Building T-1451

Well	Target Analyte	Exceeds Endpoint Criteria	Highest Concentration Last Two Sampling Periods (µg/L)	Endpoint Criteria <sup>1</sup> (µg/L)	Sampling Periods (n)	Mann-Kendall Statistic (S)	Mann-Kendall Trend			Sen's Slope			
							Trend at 80% C.I.	Trend at 95% C.I.	Concentration Stability <sup>2</sup>	Median Slope	Statistically Significant Trend	2-Tailed Test at 80% C.I.	
											Lower Limit	Upper Limit	
01-118	DRO	Yes	10,000Y	1,500	10	-2	No trend	No trend	Stable	NC	NC	NC	NC

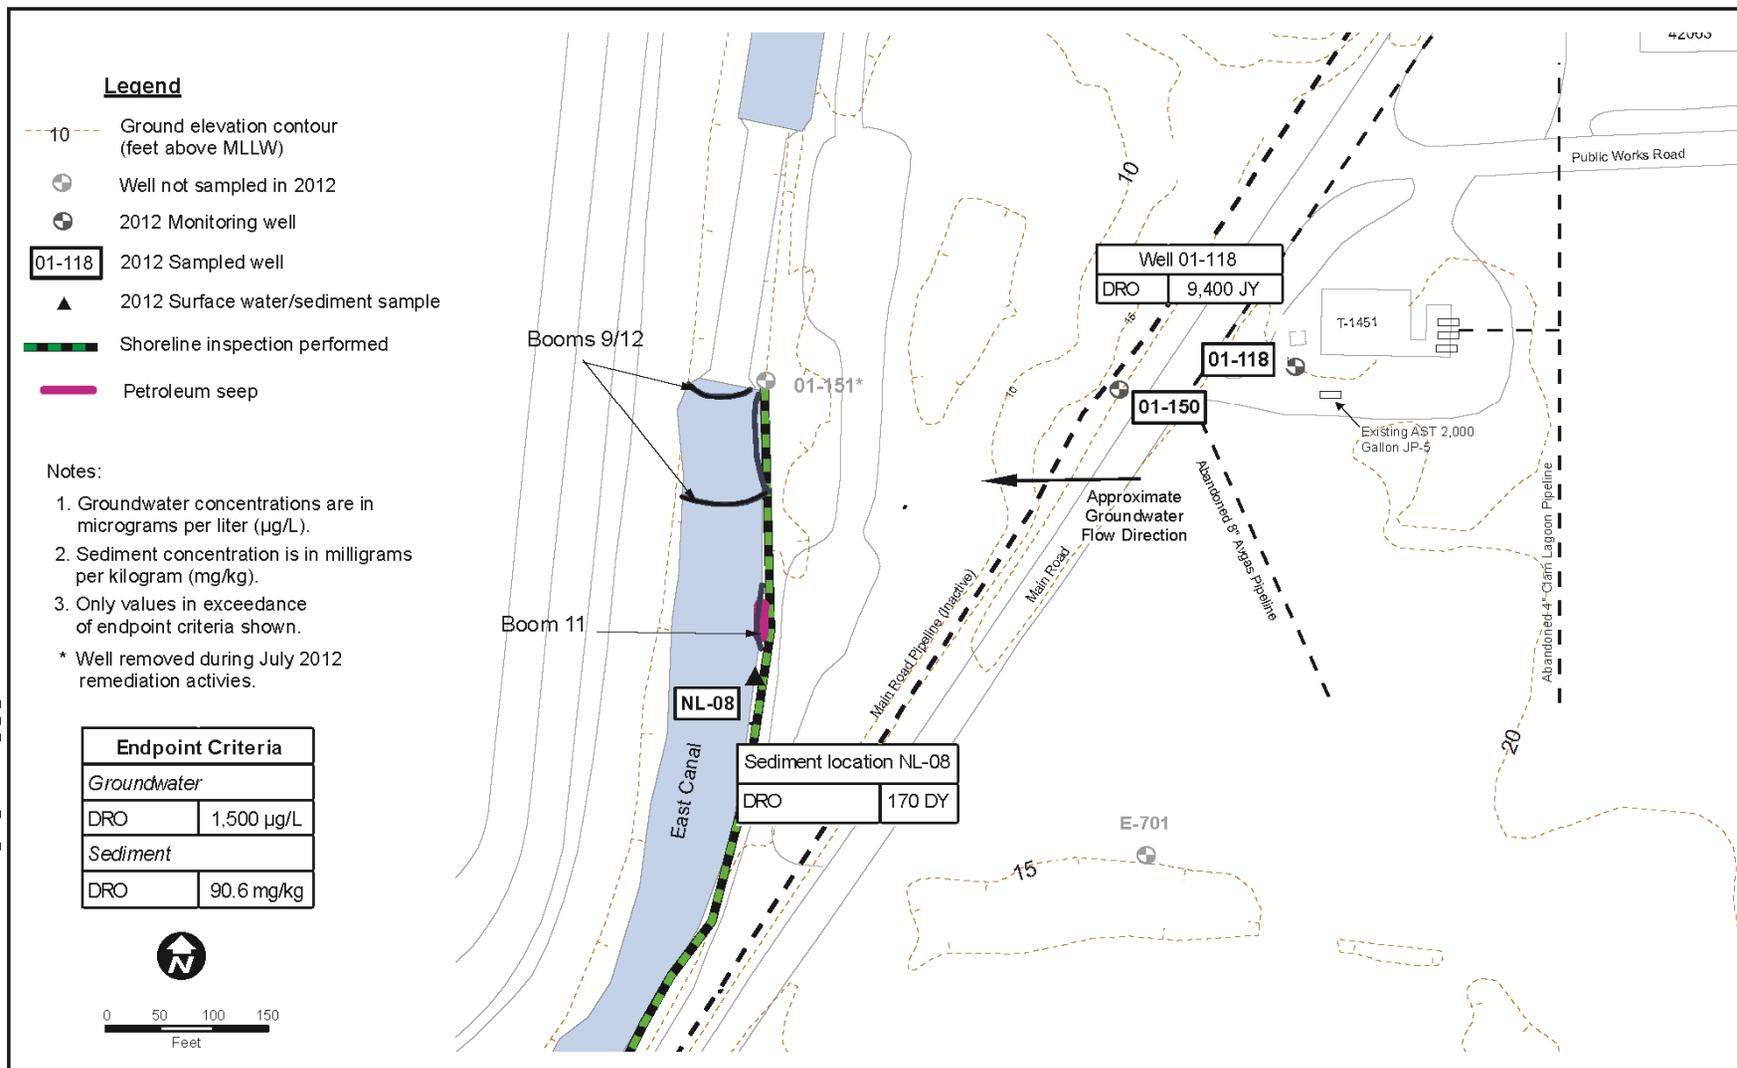

*Notes:*

<sup>1</sup> Endpoint criteria are established from ADEC cleanup levels for groundwater used as a drinking water source.

<sup>2</sup> Concentration stability is determined from the coefficient of variation when no trend exists at the 80% confidence interval (C.I.).

Sen's Slope is calculated for target analytes with decreasing concentration trends only.

 2012 Annual Groundwater  
 Monitoring Report

## **8. GCI COMPOUND, UST GCI-1**

This section presents the results of groundwater monitoring performed at the GCI Compound, UST GCI-1 site during 2012. The remedy specified for this site in the OU A ROD is free product recovery (Navy et al. 2000). MNA with ICs was selected by the Navy and ADEC as the post-free product recovery remedy for this site (Navy and ADEC 2005). To comply with requirements specified for the MNA remedy, the Navy conducts annual groundwater monitoring. Groundwater samples are collected from these wells to evaluate groundwater quality relative to Alaska groundwater cleanup levels (18 AAC 75.345) and to evaluate natural attenuation.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, a discussion of natural attenuation conditions, an interpretation of groundwater flow direction based on groundwater levels, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, trend evaluation analyses for historical target analyte concentration data, conclusions based on these analyses, and recommendations for future monitoring activities.

### **8.1 FIELD MEASUREMENTS**

Depth-to-water and product thickness measurements were collected at nine monitoring wells on the site on September 3, 2012. Table 8-1 provides the measured depths to water (corrected for product thickness, if present), calculated groundwater elevations, and if present the product thickness. Figure 8-1 shows the locations of the wells relative to potential source areas at the GCI Compound site, the site topography, and the interpreted groundwater flow direction. A discontinuous perched aquifer was previously identified in the location of the former UST (Navy 2004), but none of the wells measured in 2012 are representative of this shallow water table. The water level data indicate that the direction of groundwater flow in the main aquifer beneath the site is to the west, toward East Canal. Product was observed in two wells, 04-201 and 04-202 at trace levels and 0.01 feet, respectively.

Groundwater sampling was performed at six monitoring wells on September 3 and 4, 2012. Field measurements were recorded on the field forms and logbooks during monitoring well sampling activities (Appendix A). Table 8-1 presents the final field measurements recorded prior to sample collection.

**Table 8-1.** 2012 Field Measurements for GCI Compound, UST GCI-1

Well Location	Physical Measurements				Groundwater Parameters						
	Casing Elevation (ft MLLW)	Depth to Water (ft BTOC)	Groundwater Surface Elevation (ft MLLW)	Measured Product Thickness (ft)	pH (SU)	Specific Conductance (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Temperature (°C)	Salinity (%)	ORP (mV)
04-100	32.80	28.11	4.69	0	6.36	0.301	45.1	0.00	5.81	0.0	-34
04-201	30.61	25.63	4.98	Trace	NP	NP	NP	NP	NP	NP	NP
04-202	30.90	25.76 <sup>1</sup>	5.14 <sup>1</sup>	0.01	6.22	0.248	77.6	0.66	6.69	0.0	-13
04-203	31.13	26.27	4.86	0	NP	NP	NP	NP	NP	NP	NP
04-204	30.82	25.68	5.14	0	6.44	0.223	39.6	0.00	6.56	0.0	-17
04-210	29.22	24.72	4.50	0	6.35	0.284	7.7	0.00	5.64	0.0	-36
04-211	28.45	23.75	4.70	0	NP	NP	NP	NP	NP	NP	NP
04-213	28.70	23.76	4.94	0	6.25	0.246	41.6	0.00	6.41	0.0	-25
04-701	18.19	14.13	4.06	0	6.39	0.297	32.5	0.00	6.58	0.0	-31

*Notes:*

<sup>1</sup> Corrected for presence of product in the well.

The reported casing elevation is the surveyed elevation residing in the NIRIS database.

The last groundwater parameter measurement prior to sample collection is reported.

Groundwater parameters stabilized at all monitoring wells except wells 04-100, 04-202, and 04-701. Because groundwater parameters did not stabilize in these wells, three casing volumes of groundwater were removed prior to sampling per CMP Revision 5 (Navy 2012e). The 2012 analytical results in these wells are consistent with past analytical results and appear to be unaffected by the lack of stabilization.

## **8.2 TARGET ANALYTE RESULTS**

The groundwater samples collected from wells 04-100, 04-202, 04-204, 04-210, and 04-213 were analyzed for GRO and DRO. The sample from well 04-701 was analyzed for GRO only.

Figure 8-1 shows the locations of the wells sampled and summarizes the analytical results that exceeded the applicable endpoint criteria. Wells 04-210, 04-213, and 04-100 are situated within and near the interpreted margins of the dissolved hydrocarbon plume. Well 04-204 is located on the upgradient edge of the dissolved hydrocarbon plume. Because of the presence of free product observed in the past, well 04-202 is assumed to be close to the inferred source area. Table 8-2 summarizes the analytical results. The historical analytical results obtained for these locations are summarized in Appendix C. Laboratory reports presenting the 2012 results are provided in Appendix F.

GRO was detected above the endpoint criteria of 1,300 µg/L in samples collected from wells 04-100 (3,800 µg/L), 04-202 (3,400 µg/L), 04-210 (6,300 µg/L), and 04-213 (3,900 µg/L). DRO was not detected above the endpoint criteria of 1,500 µg/L in any of the samples collected from site wells.

## **8.3 MONITORED NATURAL ATTENUATION**

NAPs were collected at this site in 2009 to determine whether natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data indicated that biodegradation of petroleum hydrocarbons is likely occurring by iron (II) reduction; sulfate reduction; and methanogenesis as shown by elevated ferric iron concentrations, depleted sulfates, and elevated methane concentrations in comparison to background conditions. Groundwater parameters collected during the 2012 LTM event, which are presented in Table 8-1, provide evidence of continued natural attenuation as shown by the reducing environment (negative ORP) and depleted dissolved oxygen (0.0 mg/L). A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

**Table 8-2.** Analytical Results for Petroleum-Related Chemicals for GCI Compound, UST GCI-1

## 8.4 TREND EVALUATION

Statistical trend evaluations were conducted for target analyte concentrations in groundwater in accordance with the CMP, Revision 5 (Navy 2012e).

Trend evaluation was conducted for only analytes that exceeded the endpoint criteria within the last two sampling events and had a minimum of four data points. Sen's slopes were calculated only for wells with decreasing trends. The results of the Mann-Kendall and Sen's trend evaluations are presented in Table 8-3. Worksheets and graphs are provided in Appendix H.

The following are the results of the statistical evaluation:

- Well 04-100: The GRO concentration exhibits a decreasing trend at the 80 percent confidence interval. Sen's evaluation also indicates a statistically significant decreasing trend, with a median slope of -188.
- Wells 04-202, 04-210, and 04-213: The GRO concentrations exhibit no trend at either the 80 or 95 percent confidence interval. The coefficients of variation indicate the concentrations are stable.

## 8.5 CONCLUSIONS

This section presents conclusions based on a review of analytical results obtained for groundwater monitoring conducted at the GCI Compound, UST GCI-1 in 2012. The conclusions are as follows:

- Groundwater Flow: Based on the field measurements in 2012, the interpreted groundwater flow direction is to the west.
- MNA: The groundwater parameters obtained during the 2012 LTM event support evidence that natural attenuation of petroleum hydrocarbons continues to occur at the site.
- Product was observed in two wells at this site in 2012. Product was measured in well 04-201 at trace levels and in well 04-202 at a thickness of 0.01 feet.
- DRO was analyzed in all wells in 2012 for the first time but did not exceed endpoint criteria in any well.
- Well 04-100: This well is located within the contaminant plume. DRO concentrations were below endpoint criteria. The GRO concentration in 2012 exceeded the endpoint criteria. Mann-Kendall trend and Sen's evaluation performed on the GRO data collected between 2003 and 2012 indicates the concentration is decreasing with a statistical significance with an 80% degree of confidence.

- Well 04-202: This well is located within the contaminant plume. DRO concentrations were below endpoint criteria. The GRO concentration in 2012 exceeded the endpoint criteria. Mann-Kendall performed on the GRO data collected between 2002 and 2012 indicates the concentration is stable with no trend at both the 80 and 95 percent confidence intervals.
- Well 04-204: This well is located upgradient of the contaminant plume. GRO has been detected at concentrations below the endpoint criteria in this upgradient well since 2006, when sampling began at this well (seven consecutive events). Groundwater was analyzed for DRO in this well beginning in 2010 after the presence of 0.01 feet of free product was observed here in 2009. The DRO concentration exceeded endpoint criteria in both 2010 and 2011 but dropped below endpoint criteria in 2012.
- Well 04-210: This well is located within the contaminant plume. DRO concentrations were below endpoint criteria. GRO has been detected at concentrations above the endpoint criteria since 2002, with the exception of 2003 and 2004 when the well was not sampled. The trend evaluation performed on GRO data from 2002 to 2012 indicates no concentration trend at the 80 or 95 percent confidence interval and a stable concentration.
- Well 04-213: This well is located within the contaminant plume. DRO concentrations were below endpoint criteria. GRO has been detected above the endpoint criteria since 2006, when sampling began at this well. The trend evaluation performed on GRO data indicates a stable concentration with no statistical trend at either the 80 or 95 percent confidence interval.
- Well 04-701: GRO has been detected below the endpoint criteria in this downgradient well since 2006, when sampling began.

## 8.6 RECOMMENDATIONS

DRO was observed above endpoint criteria in 2010 and 2011 at upgradient well 04-204; therefore, DRO was added to analytical suite for all but one well in 2012 to determine if DRO was prevalent across the site. No groundwater sample analyzed for DRO was found to exceed endpoint criteria in 2012. This suggests that the DRO observed in well 04-204 in 2010 and 2011 was not from onsite sources. It is possible that the presence of DRO in this well was from an upgradient source, such as the 2009 decommissioning of the Main Road

Pipeline which has since dissipated. Therefore, it is recommended that DRO sampling at this site be discontinued.

Because natural attenuation is progressing at this site and because past monitoring has shown incremental changes to the site, it is recommended that all monitoring at this site be reduced to every odd year with the next monitoring to occur in 2013.

**Table 8-3.** Concentration Trend Evaluation for GCI Compound, UST GCI-1

Well	Target Analyte	Exceeds Endpoint Criteria	Highest Concentration		Sampling Periods (n)	Mann-Kendall Statistic (S)	Mann-Kendall Trend			Sen's Slope			
			Last Two Sampling Periods (µg/L)	Endpoint Criteria <sup>1</sup> (µg/L)			Trend at 80% C.I.	Trend at 95% C.I.	Concentration Stability <sup>2</sup>	Median Slope	Statistically Significant Trend	2-Tailed Test at 80% C.I.	
												Lower Limit	Upper Limit
04-100	GRO	Yes	3,800 Y	1,300	10	-18	Decreasing	No trend	NA	-188	Yes	-325	-5
04-202	GRO	Yes	3,400 Y	1,300	5	-4	No trend	No trend	Stable	NC	NC	NC	NC
04-210	GRO	Yes	6,300 Y	1,300	9	0	No trend	No trend	Stable	NC	NC	NC	NC
04-213	GRO	Yes	4,000 Y	1,300	7	-5	No trend	No trend	Stable	NC	NC	NC	NC

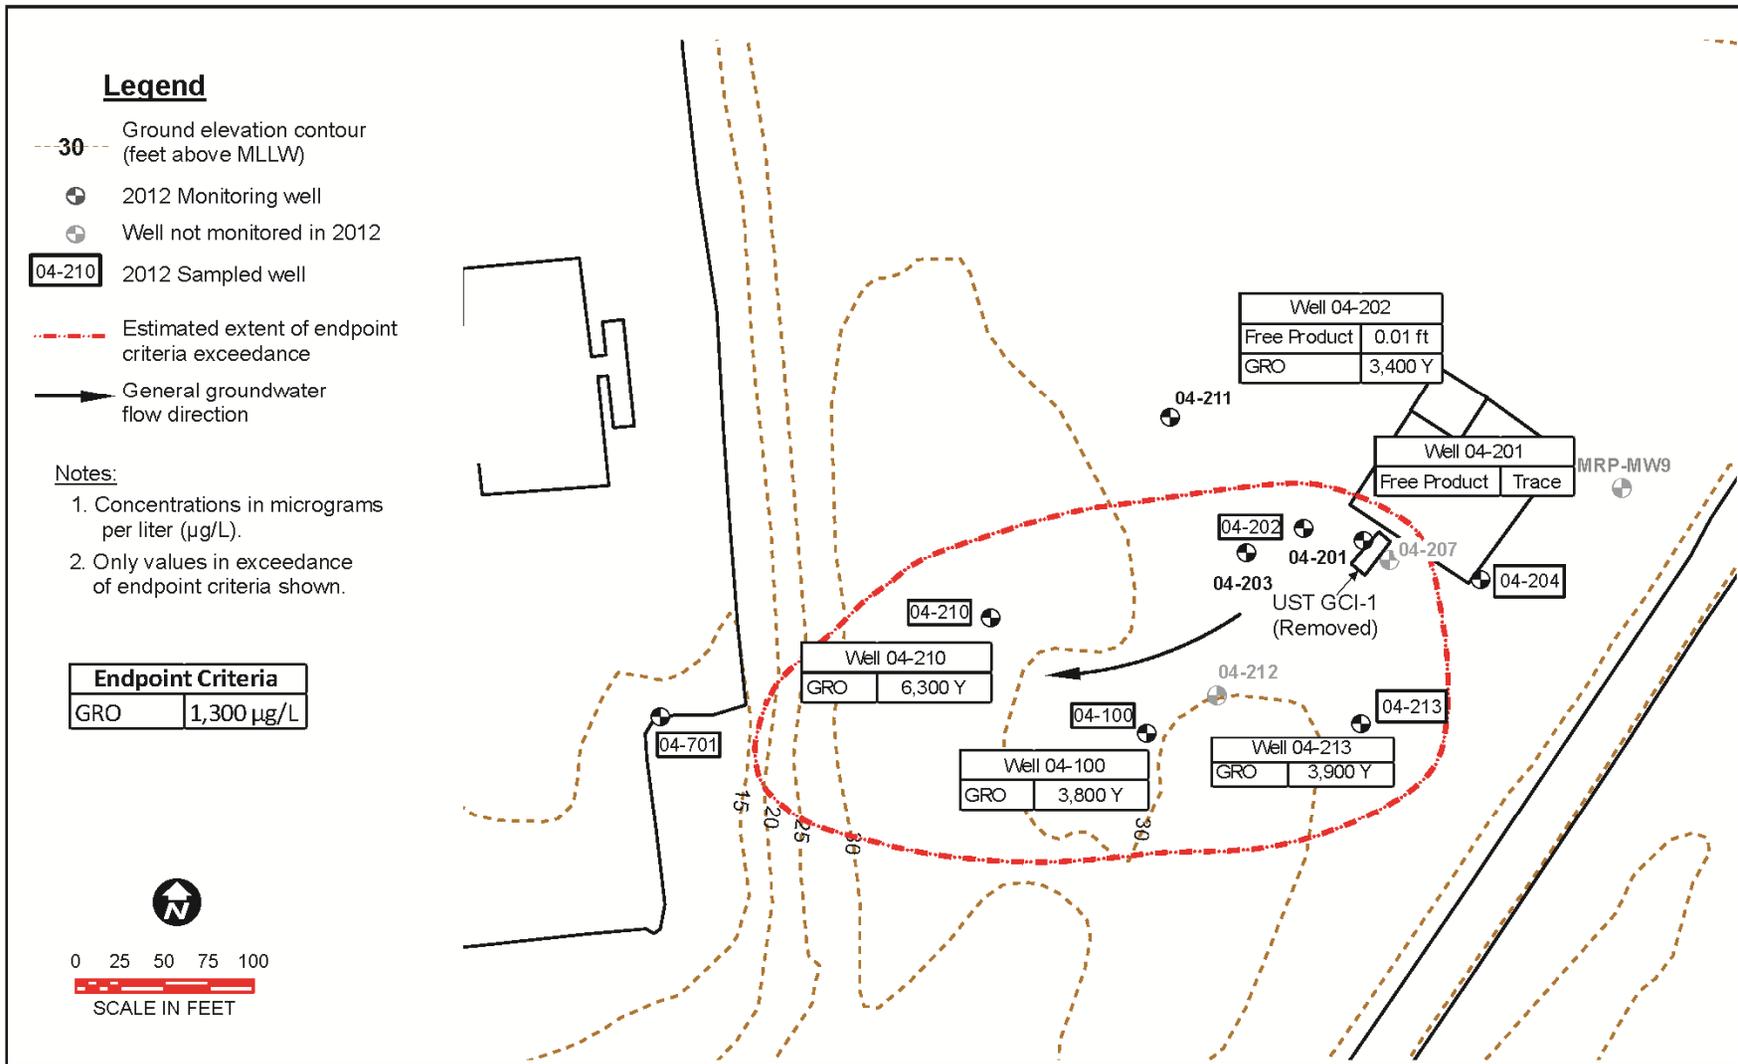

*Notes:*

<sup>1</sup>Endpoint criteria are established from ADEC cleanup levels for groundwater used as a drinking water source.

<sup>2</sup>Concentration stability is determined from the coefficient of variation when no trend exists at the 80% confidence interval (C.I.).

Sen's Slope is calculated for target analytes with decreasing concentration trends only.

---------------------------	--	--

## **9. NMCB BUILDING T-1416 EXPANDED AREA**

This section presents the results of groundwater monitoring performed at the NMCB T-1416 Expanded Area (henceforth referred as NMCB) during 2012. The remedy specified for this site in the OU A ROD is interim free product recovery followed by determination of further remedies using the focused feasibility study (FFS) process. In 2006, the Final Decision Document for the NMCB selected the preferred remedies of ICs, free product recovery, and MNA for the site (Navy 2006d). During the contract year 2007/2008, the site met the endpoint criteria for free product recovery of less than a rolling average of 5 gallons per month for 6 months. Monthly free product activities ceased for this site but were restarted in June 2010 to meet surface water protection goals. Annual groundwater monitoring is conducted as part of the prescribed long-term monitoring. Groundwater samples are collected to evaluate groundwater quality relative to specified endpoint criteria in order to verify that natural attenuation is occurring and to monitor for surface water protection.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, a discussion of natural attenuation conditions, an interpretation of groundwater flow direction based on water levels, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, conclusions based on these analyses, and recommendations for future monitoring activities at the site. Groundwater at NMCB is not considered to be a potential future water source due to the potential for salt water intrusion, as per Alaska regulations (18 AAC 75.345[b][2]). The endpoint criteria are set at 10 times the 18 AAC 75.345[b][2] Table C groundwater cleanup levels.

### **9.1 FIELD MEASUREMENTS**

Depth-to-water and product thickness measurements were collected at 25 monitoring wells on August 28, 2012. Field measurements were recorded in the field forms and logbooks during monitoring well sampling activities (Appendix A). Table 9-1 provides the measured depths to water, the calculated groundwater elevations, and if present the product thicknesses. Depth-to-water and groundwater elevations have been corrected for the presence of free product in those wells with detectable thickness (Appendix D). Figure 9-1 shows the locations of wells at the site, the site topography, the interpreted groundwater flow direction, and the downgradient surface water body (Sweeper Cove).

Notes:

<sup>1</sup> Corrected for presence of free product in the well.

The reported casing elevation is the surveyed elevation residing in the NIRIS database. The last groundwater parameter measurement prior to sample collection is reported.

9-2

The water level data indicate that a groundwater high, or divide, occurs in the main aquifer beneath the site parallel to Seawall Road. The groundwater south of Seawall Road flows south toward Sweeper Cove. North of Seawall Road, the groundwater flows to the northwest, toward East Canal. The wells along the Sweeper Cove shoreline are influenced by tidal fluctuations.

A total of 11 groundwater samples were collected from onsite wells on August 29, 2012. A review of the sampling data reported for this site indicates that groundwater parameters stabilized at all monitoring wells except 02-455 and E-201 which required the removal of three casing volumes of groundwater prior to sampling per CMP Revision 5 (Navy 2012e). The 2012 analytical results in these wells are consistent with past analytical results and appear to be unaffected by the lack of stabilization. Table 9-1 lists the final water quality parameters measurements recorded at each monitoring well prior to sample collection.

Measurable free product was detected in wells 02-818 (0.05 feet), NMCB-07 (0.37 feet), and NMCB-10 (0.21 feet). Therefore, sampling was not performed at these wells as planned per the CMP. Measureable free product was also observed in wells 02-300 (at a thickness of 0.69 feet), 02-497 (at a thickness of 0.08 feet), 02-815 (at a thickness of 0.05 feet), and NMCB-11 (at a thickness of 0.01 feet). Monthly product recovery activities were performed at this site from October 2011 through September 2012. Approximately 0.82 gallons of free product was removed from site wells during this time period (see Appendix J).

An inspection was conducted along the shoreline of Sweeper Cove between wells 02-451 and 02-479 (Figure 9-2). No evidence of petroleum contamination was observed along the shoreline. A shoreline sediment sample was collected downgradient of well NMCB-07 because of observations of petroleum odor during past shoreline inspections. Sediment sample NL-05 was collected at this location for analyses of DRO, GRO, and benzene. Results of shoreline inspections are summarized in Section 4.1.3.

## **9.2 TARGET ANALYTE RESULTS**

Eleven groundwater samples were collected and analyzed for DRO, GRO, and benzene. A sediment sample NL-05 was collected from the shoreline downgradient of well NMCB-07 and also analyzed for DRO, GRO, and benzene. Figure 9-1 shows the locations of the wells sampled, the sediment sample location, and the analytical results for samples exceeding the applicable endpoint criteria. The general upland area of the dissolved contaminant plume currently exceeding the applicable endpoint criteria is designated on Figure 9-1. Table 9-2 presents the groundwater analytical results since 2006 for all site monitoring wells. Table 9-3 presents the sediment analytical results. The historical analytical results obtained for these locations are summarized in Appendix C. Laboratory forms presenting the 2012 results are provided in Appendix F.

DRO, GRO, and benzene were not detected above their respective endpoint criteria of 15,000 µg/L, 13,000 µg/L, and 50 µg/L, respectively, in any groundwater samples collected in 2012. GRO and benzene were not detected above method detection limits their respective endpoint criteria in sediment sample NL-05 and DRO was not detected above its respective endpoint criteria of 90.6 mg/kg which was established for South Sweeper Creek sediments. This criteria was used for comparison because no sediment endpoint criteria have been established for NMCB.

### **9.3 MONITORED NATURAL ATTENUATION**

NAPs were collected at this site in 2009 to determine whether natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data indicated that biodegradation of petroleum hydrocarbons is likely occurring by iron (II) reduction; sulfate reduction; and methanogenesis as shown by elevated ferric iron concentration, depleted sulfates, and elevated methane concentrations in comparison to background conditions. Groundwater parameters presented in Table 9-1 collected during the 2012 LTM event supports evidence of continued natural attenuation as shown by the reducing environment (negative ORP) and depleted dissolved oxygen (0.0 mg/L) within the plume. A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

### **9.4 TREND EVALUATION**

Statistical trend evaluations were conducted for target analyte concentrations in groundwater in accordance with the CMP, Revision 5 (Navy 2012e). Trend evaluation was conducted for only analytes that exceeded the endpoint criteria within the last two sampling events and had a minimum of four data points. Sen's evaluations were performed on decreasing trends only. The results of the trend evaluation performed for this site are presented in Table 9-4. Worksheets and graphs are provided in Appendix H.

The following are the results of the statistical evaluation:

- Well 02-461: The GRO concentration exhibits no trend at either the 80 or 95 percent confidence interval. The coefficient of variation indicates the concentration is stable.
- Well E-201: The GRO concentration exhibits no trend at either the 80 or 95 percent confidence interval. The coefficient of variation indicates the concentration is stable.

Endpoint Criteria <sup>1</sup>		15,000	13,000	50

Notes:

<sup>1</sup> The endpoint criteria are 10 times the ADEC cleanup levels for groundwater as a drinking water source and as specified in 18 AAC 75.345[b][1], Table C.

<sup>2</sup> Indicates well had greater than 0.02 feet of product that was bailed off prior to sampling; results are potentially elevated due to presence of free product.

**Bold** indicates reported concentration is greater than the endpoint criteria.

**Table 9-3.** Analytical Results for Sediment at NMCB

Location	Year	DRO (mg/kg)	GRO (mg/kg)	Benzene (mg/kg)
NL-05	2009	40 YH	7.0 U	0.025 U
	2010	61 H	6.8 U	0.049 U
	2011	<b>120 DY</b>	6.4 U	0.064 U
	2012	59 Y	5.4 U	0.073 U
Endpoint Criteria <sup>1</sup>		90.6	12.2	none

Note:

<sup>1</sup> Endpoint criteria for East Canal have not been established so endpoints for South Sweeper Creek were used.

**Table 9-4.** Concentration Trend Evaluation for NMCB

Well	Target Analyte	Exceeds Endpoint Criteria	Highest Concentration Last Two Sampling Periods (µg/L)	Endpoint Criteria <sup>1</sup> (µg/L)	Sampling Periods (n)	Mann-Kendall Statistic (S)	Mann-Kendall Trend			Sen's Slope			
							Trend at 80% C.I.	Trend at 95% C.I.	Concentration Stability <sup>2</sup>	Median Slope	Statistically Significant Trend	2-Tailed Test at 80% C.I.	
											Lower Limit	Upper Limit	
02-461	GRO	No	14,000 DY	13,000	7	-4	No trend	No trend	Stable	NC	NC	NC	NC
E-201	GRO	No	17,000 DY	13,000	7	-2	No trend	No trend	Stable	NC	NC	NC	NC

*Notes:*

<sup>1</sup> Endpoint criteria are established from risk-based cleanup levels.

<sup>2</sup> Concentration stability is determined from the coefficient of variation when no trend exists at the 80% confidence interval (C.I.).

Sen's Slope is calculated for target analytes with decreasing concentration trends only.

## 9.5 CONCLUSIONS

This section presents the conclusions based on a review of analytical results obtained for groundwater monitoring conducted at the NMCB during 2012. The conclusions are as follows:

- **Groundwater Flow:** The interpreted groundwater flow direction in September 2012 is south toward Sweeper Cove and northwest toward East Canal north of Seawall Road.
- **MNA:** The groundwater parameters obtained during the 2012 LTM event provide evidence that natural attenuation of petroleum hydrocarbons continues to occur at the site.
- **Measurable free product** was detected in Seven wells 02-300 (0.69 feet), 02-497 (0.08 feet) 02-815 (0.05 feet), 02-818 (0.05 feet), NMCB-07 (0.37 feet), NMCB-10 (0.21 feet), and NMCB-11 (0.01 feet).
- **Well 02-452:** This well is located upgradient of the contaminant plume. DRO, GRO, and benzene concentrations remain below their respective endpoint criteria since sampling began in 2006 (seven consecutive sampling events).
- **Well 02-453:** This well is located within the contaminant plume. DRO, GRO, and benzene concentrations remain below their respective endpoint criteria since sampling began in 2006 (seven consecutive sampling events).
- **Well 02-455:** This well is located cross-gradient between two contaminant plumes. DRO, GRO, and benzene concentrations remain below their respective endpoint criteria since sampling began in 2006 (six sampling events).
- **Well 02-461:** This well is located upgradient of the contaminant plume. GRO was detected at a concentration above the endpoint criteria in 2011 but the concentration dropped below endpoint criteria in 2012. DRO and benzene concentrations have remained below their respective endpoint criteria since 2006 (seven consecutive sampling events).
- **Well 02-478:** This well is located between two contaminant plumes. DRO, GRO, and benzene concentrations remain below the endpoint criteria since sampling began in 2006 (seven consecutive sampling events).
- **Well 02-817:** This well is upgradient of the contaminant plume. DRO, GRO, and benzene concentrations remain below their respective endpoint criteria since 2008 (five consecutive sampling events).
- **Well 02-818:** This well is located within the contaminant plume. The well was not sampled due to the presence of free product measuring 0.05 feet in thickness.

- Well E-201: This well is located upgradient of the contaminant plume past Seawall Road. GRO was detected at a concentration above the endpoint criteria of 13,000 µg/L in 2011 but dropped below the endpoint criteria in 2012. DRO and benzene concentrations remain below their respective endpoint criteria since 2006 (seven consecutive sampling events).
- Well NMCB-04: This well is located upgradient of the contaminant plume near Main Road. DRO, GRO, and benzene were below their respective endpoint criteria since 2006 (two consecutive sampling events).
- Well NMCB-07: This well is located within the contaminant plume. The well was not sampled due to the presence of free product measuring 0.37 feet in thickness.
- Well NMCB-08: This well is located between two contaminant plumes. GRO and benzene concentrations remain below their respective endpoint criteria since sampling began in 2006 (seven consecutive sampling events). DRO has remained below the endpoint criteria since 2008 (five consecutive sampling events).
- Well NMCB-10: This well is located within the contaminant plume. The well was not sampled due to the presence of free product measuring 0.21 feet in thickness.
- Well NMCB-11: This well is located within the contaminant plume. DRO, GRO, and benzene concentrations remain below their respective endpoint criteria since sampling began in 2006 (seven consecutive sampling events). Free product was measured in this well at a thickness of 0.01 feet.
- Well NMCB-12: This well is located within the contaminant plume. DRO, GRO, and benzene concentrations remain below their respective endpoint criteria since sampling began in 2006 (seven consecutive sampling events).
- Sediment sample NL-05: DRO and GRO concentrations did not exceed endpoint criteria established for the South of Runway 18-36 site. The benzene concentration was not detected above method detection limits. This sample was collected from the shoreline downgradient of well NMCB-07. No visible observations of petroleum contamination were noted during sample collection.
- The shoreline inspection of Sweeper Cove between wells 02-451 and 02-479 did not reveal any groundwater seeps, odors, sheen, or discoloration that indicated petroleum contamination.

## 9.6 RECOMMENDATIONS

No observances of endpoint criteria exceedances were observed in any sample collected from this site in 2012. Observances of free product in 2012 included three areas including wells 02-300, 02-497, 02-453, 02-818, NMCB-07, NMCB-10, NMCB-11, and NMCB-12 (Figure 9-1).

Because of the lack of exceedances of endpoint criteria for at least five consecutive sampling events at wells 02-452, 02-453, 02-455, 02-478, 02-817, NMCB-08, and NMCB-12 it is recommended that sampling at these wells be discontinued but that monitoring for free product continue during LTM activities due to these well's proximity to the areas of exceedance. It is further recommended that sampling be discontinued but that monitoring for free product continues at well NMCB-04 since product has historically been observed in this well prior to 2011.

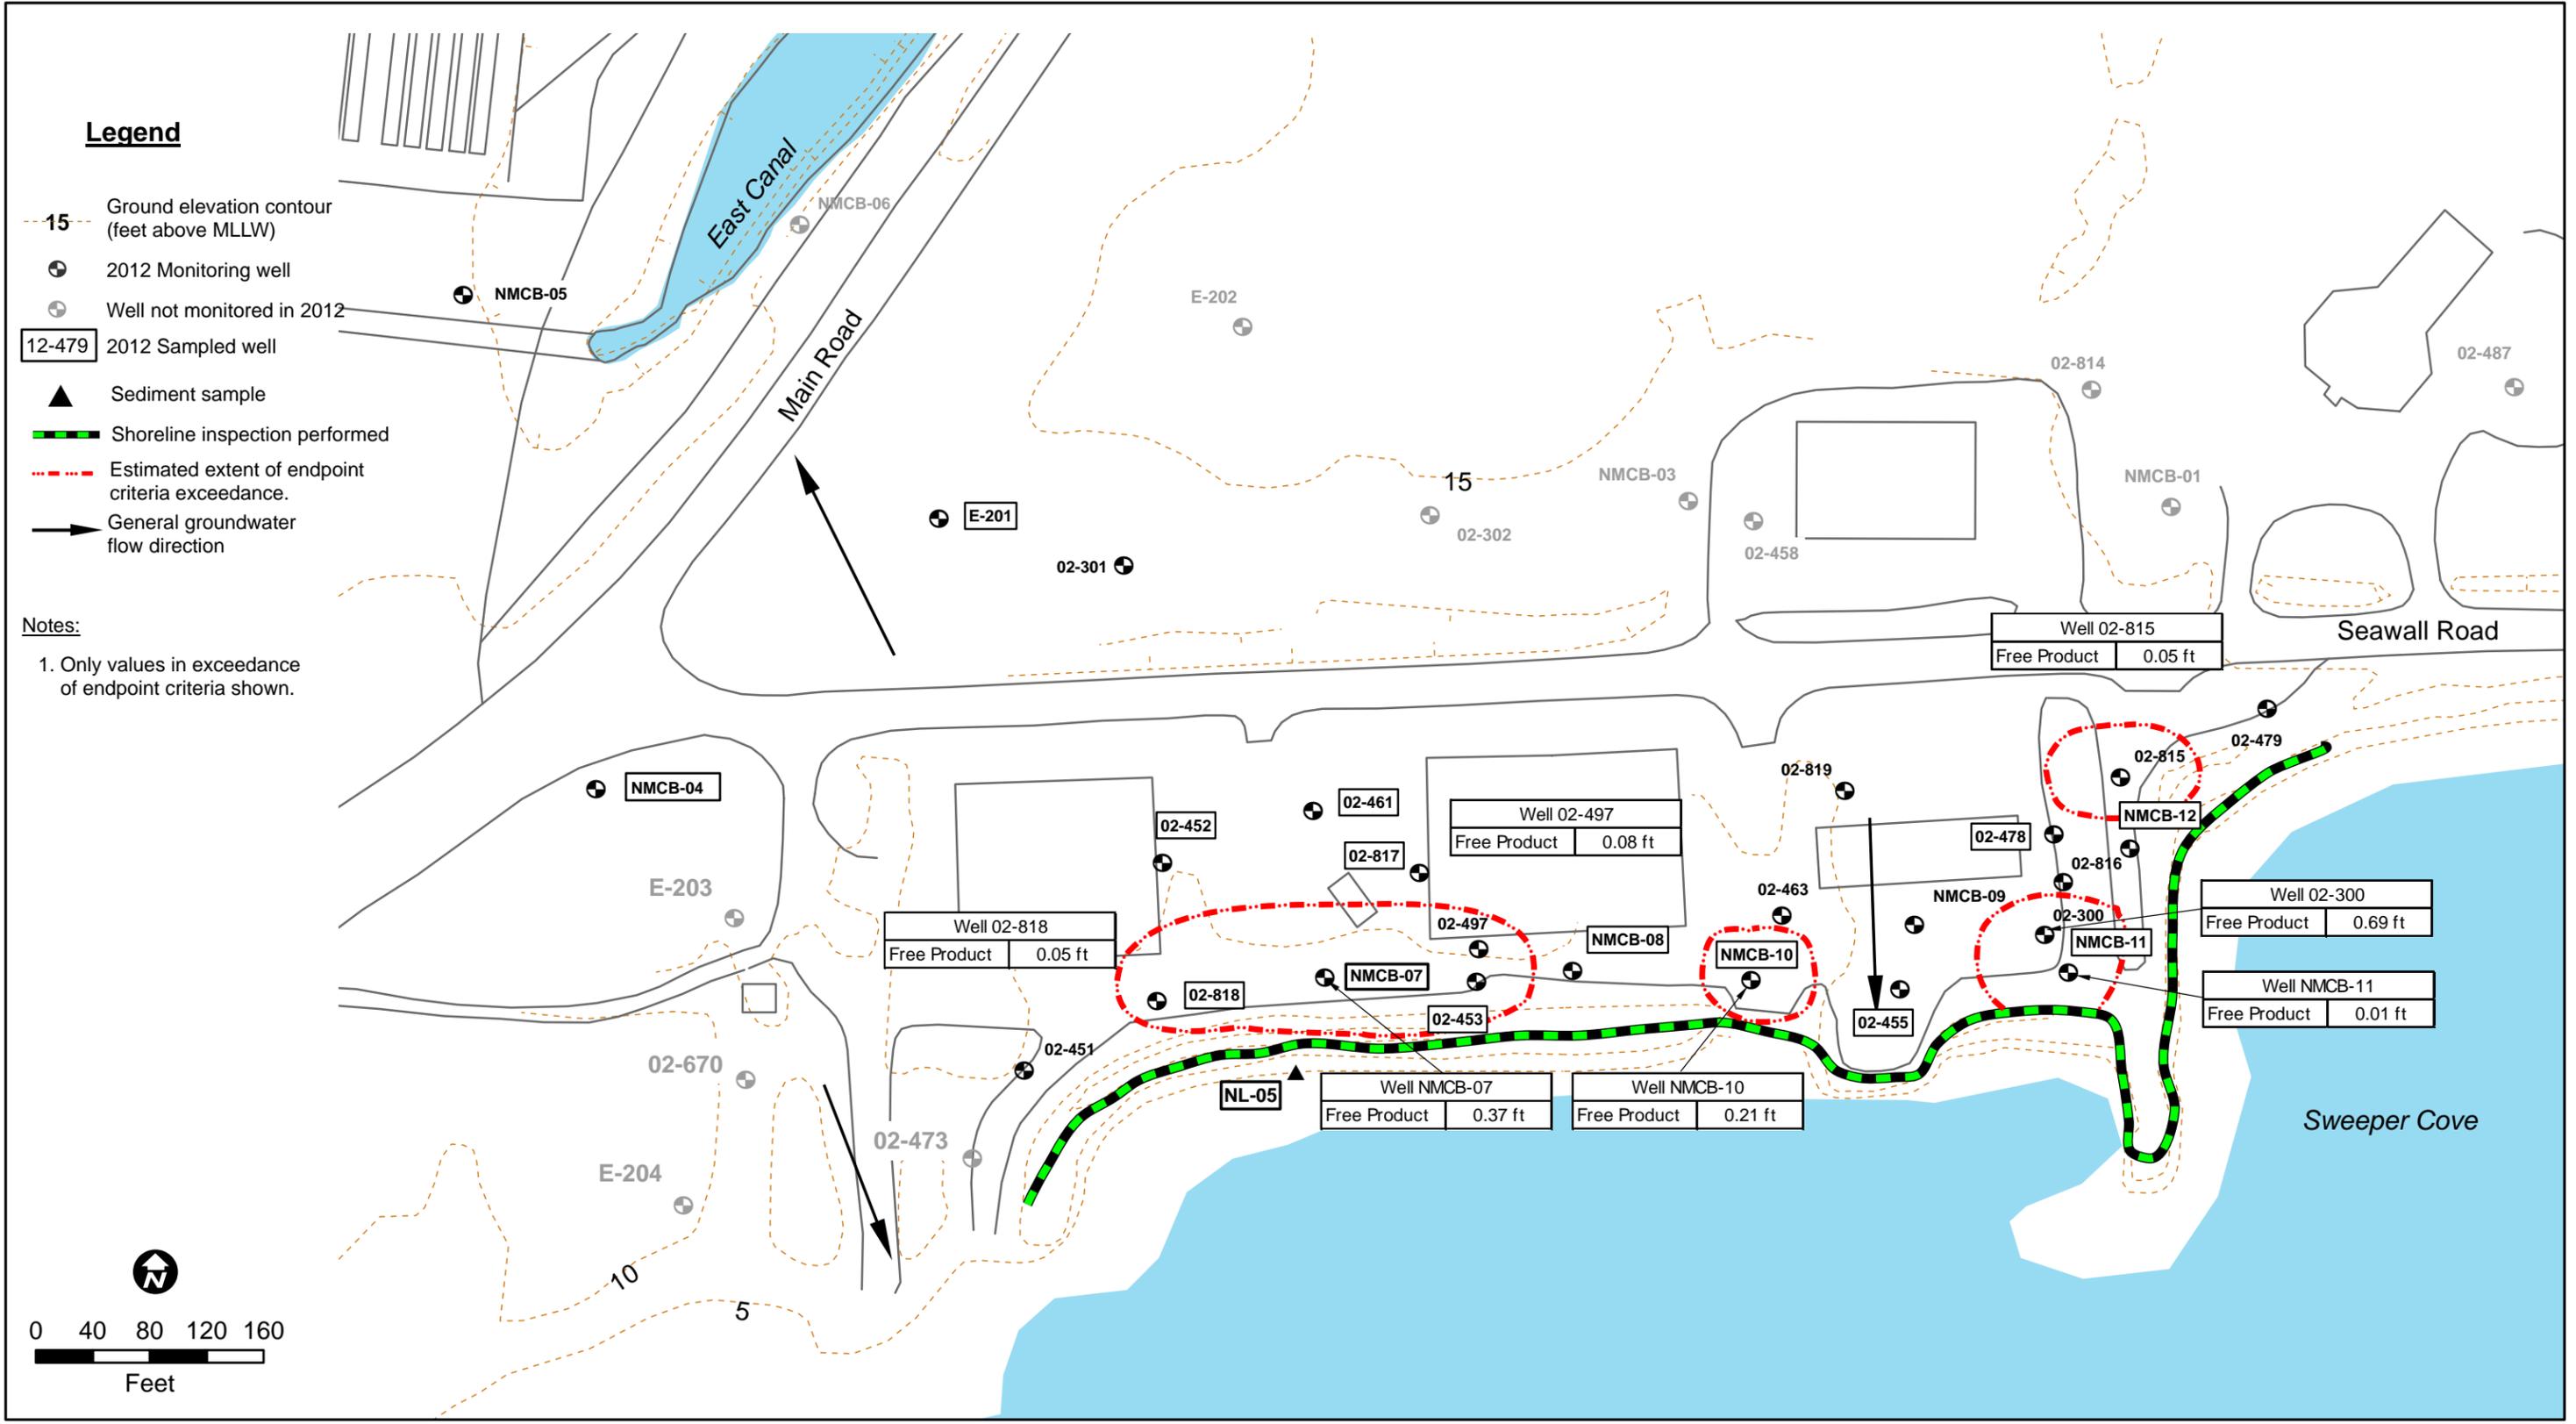

Because benzene has not exceeded endpoint criteria in any well at this site since sampling began in 2006, it is recommended that monitoring for this contaminant be discontinued at this site. Similarly, it is recommended that sampling for DRO at this site be discontinued since this contaminant has not been observed in any well since 2007.

It is also recommended that monitoring at well NMCB-05 be discontinued since groundwater concentrations have not exceeded endpoint criteria and free product has not been observed in this well since 2010.

While endpoint criteria were not exceeded in wells E-201 and 02-461 in 2012, GRO concentrations did exceed endpoint criteria in 2011. Therefore, it is recommended that sampling at these wells be reduced to every odd year with the next sampling occurring in 2013. This recommendation is consistent with CMP, Revision 5 (Navy 2012e) to align all biennial sampling to odd year sampling. All other on-site monitoring is recommended to continue due to the following:

- The continued observance of free product in six site wells during monthly recovery activities from October 2011 through September 2012 (Appendix J);
- Stable concentrations of GRO in groundwater.
- The tidal influence on groundwater flow beneath the site.

Because natural attenuation is progressing at this site and because past monitoring has shown incremental changes to the site, it is recommended that all monitoring at this site be reduced to every odd year with the next monitoring to occur in 2013.

## **10. ROICC CONTRACTOR'S AREA, UST ROICC-7**

This section presents the results of groundwater monitoring performed at the ROICC Contractor's Area, UST ROICC-7 site during 2012. Limited groundwater monitoring was the remedy selected for this site (Navy et al. 2000); however, monitoring results obtained between 1999 and 2003 identified benzene concentrations in groundwater above the determined endpoint criteria. Therefore, the Navy initiated MNA in preparation for a remedy review scheduled to take place during the 5-year review. Groundwater samples are collected from these wells to evaluate groundwater quality relative to Alaska groundwater cleanup levels (18 AAC 75.345) and to verify that natural attenuation is occurring.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, a discussion of natural attenuation conditions, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, trend evaluation analyses for historical target analyte concentrations on data, conclusions based on these analyses, and recommendations for future monitoring activities at the site.

### **10.1 FIELD MEASUREMENTS**

Depth-to-water and product thickness measurements were collected at three wells on September 7, 2012. Table 10-1 provides the measured depths to water, the calculated groundwater elevations, and if present the product thicknesses. Figure 10-1 shows the locations of the wells at ROICC Contractor's Area, UST ROICC-7, the site topography, and the interpreted groundwater flow direction. The interpreted groundwater flow direction is toward the southeast, which is in agreement with the regional setting and historical information. However, the interpreted groundwater flow direction is based on a linear orientation of wells. Free product was not observed in any of the wells in 2012.

Groundwater sampling was performed at the three scheduled monitoring wells on September 7, 2012. Field measurements were recorded on the field forms and logbooks during monitoring well sampling activities (Appendix A). Table 10-1 lists the final field measurements recorded at the monitoring wells prior to sample collection. A review of the sampling data reported for this site indicates that prior to sample collection all groundwater parameters stabilized in all wells.

**Table 10-1.** 2012 Field Measurements for ROICC Contractor's Area, UST ROICC-7

Well Location	Physical Measurements				Groundwater Parameters						
	Casing Elevation (ft MLLW)	Depth to Water (ft BTOC)	Groundwater Surface Elevation (ft MLLW)	Measured Product Thickness (ft)	pH (SU)	Specific Conductance (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Temperature (°C)	Salinity (%)	ORP (mV)
08-175	13.59	3.38	10.21	0	6.42	0.904	5	0.00	8.15	0.0	-89
08-200	14.87	4.08	10.79	0	6.52	1.76	0	0.00	8.37	0.1	-115
08-202	13.86	2.74	11.12	0	6.58	1.14	4	0.00	7.77	0.1	-120

*Notes:*

The reported casing elevation is the surveyed elevation residing in the NIRIS database.  
 The last groundwater parameter measurement prior to sample collection is reported.

## 10.2 TARGET ANALYTE RESULTS

Groundwater samples collected from wells 08-175, 08-200, and 08-202 and were analyzed for benzene. Table 10-2 presents the historical analytical results for all site monitoring wells. The historical analytical results obtained for these locations are also summarized in Appendix C. Laboratory forms presenting the 2012 results are provided in Appendix F. Figure 10-1 shows the locations of the site wells and the analytical results that exceed the applicable endpoint criteria.

**Table 10-2.** Analytical Results for Petroleum-Related Chemicals for ROICC Contractor's Area, UST ROICC-7

<b>Well Location</b>	<b>Year</b>	<b>Benzene (µg/L)</b>
08-175 Downgradient	2003	1.1 J
	2004	0.18 J
	2005	NP
	2006	1.0 U
	2007	NP
	2008	0.21 J
	2009	NP
	2010	0.15 J
08-200 Plume Source	2012	0.11 J
	2003	<b>390</b>
	2004	<b>288J</b>
	2005	<b>233 J</b>
	2006	<b>250</b>
	2007	<b>300 D</b>
	2008	<b>320 D</b>
	2009	<b>310 D</b>
08-202 Onsite	2010	<b>310 JD</b>
	2012	<b>280 D</b>
	2003	<b>24</b>
	2004	<b>16</b>
	2005	<b>14.6</b>
	2006	<b>13 J</b>
	2007	<b>14</b>
	2008	<b>16</b>
Endpoint Criteria	2009	<b>12</b>
	2010	<b>12</b>
	2012	<b>9.6</b>
		5

Notes:

**Bold** indicates reported concentration is greater than the endpoint criteria.

Benzene was detected above the endpoint criteria (5 µg/L) in the 2012 samples collected from wells 08-200 and 08-202 at concentrations of 280 µg/L and 9.6 µg/L, respectively. DRO was detected below the endpoint criteria in the sample collected from well 08-175 at a concentration of 0.11 µg/L.

### **10.3 MONITORED NATURAL ATTENUATION**

NAPs were collected at this site in 2009 to determine whether natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data indicated that biodegradation of petroleum hydrocarbons is likely occurring by iron (II) reduction; sulfate reduction; and methanogenesis as shown by elevated ferric iron concentration, depleted sulfates, and elevated methane concentrations in comparison to background conditions. Groundwater parameters presented in Table 10-1 collected during the 2012 LTM event support evidence of continued natural attenuation as shown by the reducing environment (negative ORP) and depleted dissolved oxygen (0.0 mg/L) at the site. A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

### **10.4 TREND EVALUATION**

Statistical trend evaluations were conducted for target analyte concentrations in groundwater in accordance with the CMP, Revision 5 (Navy 2012e). Trend evaluation was conducted for only analytes that exceeded the endpoint criteria within the last two sampling events and had a minimum of four data points. Sen's evaluations were performed on decreasing trends only. The results of the trend evaluation performed for this site are presented in Table 10-3. Worksheets and graphs are provided in Appendix H.

The following are the results of the statistical evaluation:

- Well 08-200: The benzene concentration exhibits no trend at the 80 and 95 percent confidence intervals. The coefficient of variation indicates the concentration is stable.
- Well 08-202: The benzene concentration exhibits a decreasing trend at both the 80 and 95 percent confidence intervals. The Sen's evaluation also indicates a statistically significant downward trend (at the 80 percent confidence interval), with a median slope of -0.886.

**Table 10-3.** Concentration Trend Evaluation for ROICC Contractor's Area, UST ROICC-7

Well	Target Analyte	Exceeds Endpoint Criteria	Highest Concentration Last Two Sampling Periods (µg/L)	Endpoint Criteria <sup>1</sup> (µg/L)	Sampling Periods (n)	Mann-Kendall Statistic (S)	Mann-Kendall Trend			Sen's Slope			
							Trend at 80% C.I.	Trend at 95% C.I.	Concentration Stability <sup>2</sup>	Median Slope	Statistically Significant Trend	2-Tailed Test at 80% C.I.	
											Lower Limit	Upper Limit	
08-200	Benzene	Yes	310 JD	5	10	7	No trend	No trend	Stable	NC	NC	NC	NC
08-202	Benzene	Yes	12	5	10	-33	Decreasing	Decreasing	NA	-0.886	Yes	-1.13	-0.68

Notes:

<sup>1</sup>Endpoint criteria are established from ADEC cleanup levels for groundwater used as a drinking water source.

<sup>2</sup>Concentration stability is determined from the coefficient of variation when no trend exists at the 80% confidence interval (C.I.).

Sen's Slope is calculated for target analytes with decreasing concentration trends only.

## 10.5 CONCLUSIONS

This section presents the conclusions based on a review of groundwater monitoring results performed at the ROICC Contractor's Area (UST ROICC-7) site in 2012. The conclusions are as follows:

- **Groundwater Flow:** The groundwater flow direction in 2012 at the site is interpreted to be to the southeast.
- **MNA:** The groundwater parameters obtained during the 2012 LTM event support evidence that natural attenuation of petroleum hydrocarbons continues to occur at the site.
- **No free product** was detected in any well at this site in 2012.
- **Well 08-175:** This well is located downgradient of the contaminant plume. Benzene was not detected above endpoint criteria in 2012 and has remained below endpoint criteria since sampling began in 2003 (six sampling events).
- **Well 08-200:** This well is located within the contaminant plume. Benzene was detected above the endpoint criteria in 2012. The trend evaluation performed on the benzene data collected between 2003 and 2012 shows stable benzene concentrations with no trend at both the 80 and 95 percent confidence intervals.
- **Well 08-202:** This well is located within the contaminant plume. Benzene was detected above the endpoint criteria in 2012. The statistical evaluation performed on the benzene data collected between 2003 and 2012 shows a decreasing trend at both the 80 and 95 percent confidence intervals. The Sen's evaluation verifies that benzene is decreasing with statistical significance in this well.

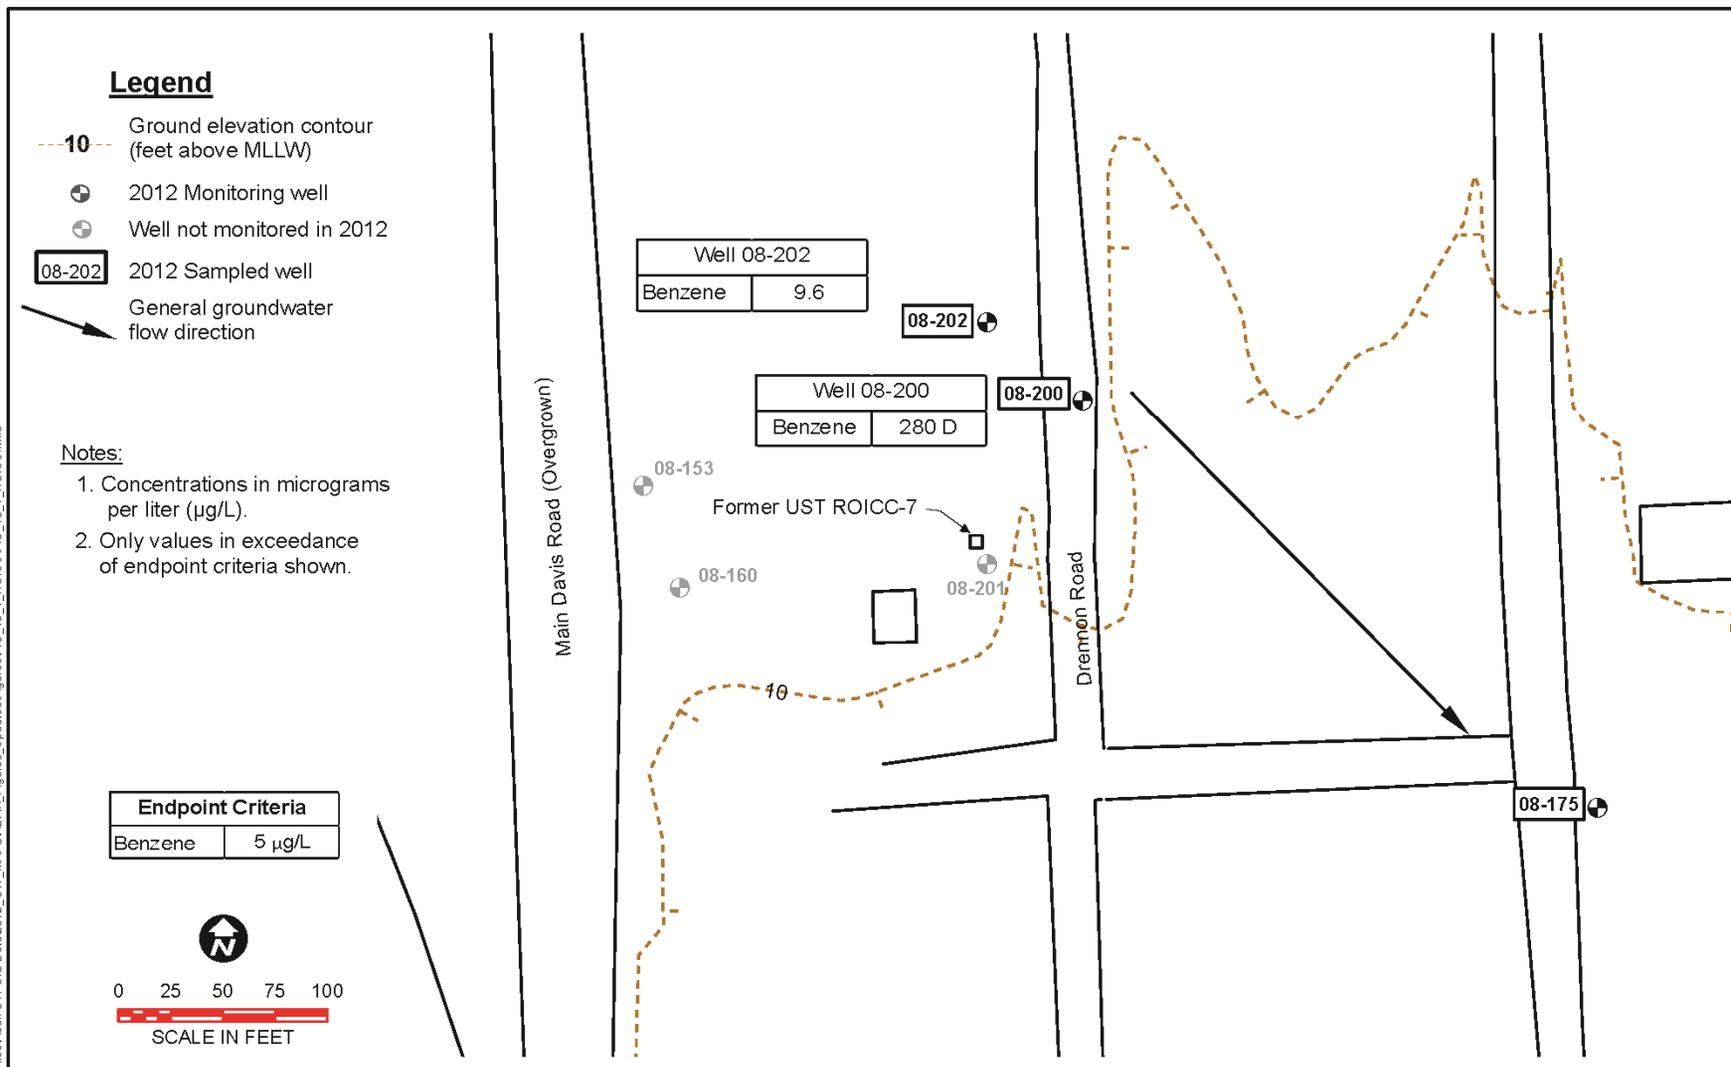

## 10.6 RECOMMENDATIONS

Because the benzene concentration in well 08-175 has remained below endpoint criteria since 2003 and because benzene concentrations are exhibiting decreasing trends, it is recommended that monitoring at this location be discontinued.

Because the benzene concentration remains above the endpoint criteria in monitoring wells 08-200 and 08-202, but exhibits stable or decreasing trends, monitoring at the site is recommended to continue to be monitored biennially on every odd year. This recommendation is consistent with CMP, Revision 5 (Navy 2012e) to align all biennial sampling to odd year sampling.

 Monitoring Report

## **11. RUNWAY 5-23 AVGAS VALVE PIT**

This section presents the results of groundwater monitoring performed at the Runway 5-23 Avgas Valve Pit site during 2012. MNA is the remedy selected for this site (Navy et al. 2000). To comply with requirements specified for this remedy, the Navy conducts periodic groundwater sampling and water level/product thickness monitoring. Groundwater samples are collected from these wells to evaluate groundwater quality relative to Alaska groundwater cleanup levels (18 AAC 75.345) and to verify that natural attenuation is occurring.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, a discussion of natural attenuation conditions, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, trend evaluation analyses for historical target analyte concentrations on data, conclusions based on these analyses, and recommendations for future monitoring activities at the site.

### **11.1 FIELD MEASUREMENTS**

Depth-to-water and product thickness measurements were collected at two wells on September 5, 2012. Table 11-1 provides the measured depths to water, the calculated groundwater elevations, and if present the product thicknesses. Figure 11-1 shows the locations of the wells at the Runway 5-23 Avgas Valve Pit and the site topography. The potentiometric surface and groundwater flow direction cannot be determined based on only two wells; however, the topography of the site and regional groundwater flow patterns indicate that the groundwater flow direction is likely east toward South Sweeper Creek.

Groundwater sampling was performed at the two scheduled monitoring wells on September 5, 2012. Field measurements were recorded on the field forms and logbooks during monitoring well sampling activities (Appendix A). Table 11-1 lists the final field measurements recorded at the monitoring wells prior to sample collection. A review of the sampling data reported for this site indicates that prior to sample collection all groundwater parameters stabilized in all wells. No free product was observed in either well during the 2012 field monitoring activities.

**Table 11-1.** 2012 Field Measurements for Runway 5-23 Avgas Valve Pit

Well Location	Physical Measurements				Groundwater Parameters						
	Casing Elevation (ft MLLW)	Depth to Water (ft BTOC)	Groundwater Surface Elevation (ft MLLW)	Measured Product Thickness (ft)	pH (SU)	Specific Conductance (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Temperature (°C)	Salinity (%)	ORP (mV)
14-100	15.06	2.56	12.50	0	6.39	0.488	18	0.00	8.97	0.0	-70
14-110	15.10	2.78	12.32	0	6.30	0.474	1	0.00	10.16	0.0	-69

*Notes:*

The reported casing elevation is the surveyed elevation residing in the NIRIS database.  
 The last groundwater parameter measurement prior to sample collection is reported.

## 11.2 TARGET ANALYTE RESULTS

Groundwater samples collected from wells 14-100 and 14-110 were analyzed for GRO. Table 11-2 presents the historical analytical results for all site monitoring wells. The historical analytical results obtained for these locations are also summarized in Appendix C. Laboratory forms presenting the 2012 results are provided in Appendix F. Figure 11-1 shows the locations of the site wells and the analytical results that exceed the applicable endpoint criteria.

GRO was detected above the endpoint criteria (1,300 µg/L) in well 14-100 at a concentration of 1,800 µg/L and below the endpoint criteria in well 14-110 at a concentration of 780 µg/L.

**Table 11-2.** Analytical Results for Petroleum-Related Chemicals for Runway 5-23 Avgas Valve Pit

Well Location	Year	GRO (µg/L)
14-100 Plume Source	2003	1,000 J
	2004	<b>3,910</b>
	2005	<b>1,770</b>
	2006	<b>3,400</b>
	2007	<b>2,000 Y</b>
	2008	<b>3,200 Z</b>
	2009	<b>3,500 Z</b>
	2010	<b>2,200 Y</b>
14-110 Downgradient	2012	<b>1,800 Y</b>
	2003	920
	2004	1,240
	2005	631
	2007	990 Y
	2008	960 Z
	2009	NP
	2010	730 Y
Endpoint Criteria		1,300

*Note:*

**Bold** indicates reported concentration is greater than the endpoint criteria.

## 11.3 MONITORED NATURAL ATTENUATION

NAPs were collected at this site in 2009 to determine whether natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data indicated that biodegradation of petroleum hydrocarbons is likely occurring by iron (II) reduction; sulfate reduction; and strong evidence of methanogenesis as shown by elevated ferric iron concentration, depleted sulfates, and elevated methane concentrations in comparison to background conditions. Groundwater parameters presented in Table 11-1 collected during

the 2012 LTM event supports evidence of continued natural attenuation as shown by the reducing environment (negative ORP) and depleted dissolved oxygen (0.0 mg/L) at the site. A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

#### **11.4 TREND EVALUATION**

Statistical trend evaluations were conducted for target analyte concentrations in groundwater in accordance with the CMP, Revision 5 (Navy 2012e). Trend evaluation was conducted only for analytes that exceeded the endpoint criteria within the last two sampling events and had a minimum of four data points. Sen's evaluations were performed on decreasing trends only. The results of the trend evaluation performed for this site is presented in Table 11-3. Worksheets and graphs are provided in Appendix H.

The following are the results of the statistical evaluation:

- Well 14-100: The GRO is stable with no trend at both the 80 and 95 percent confidence intervals.

#### **11.5 CONCLUSIONS**

This section presents the conclusions based on a review of groundwater monitoring results performed at the Runway 5-23 Avgas Valve Pit site in 2012. The conclusions are as follows:

- Groundwater Flow: The groundwater flow direction in 2012 at the site is interpreted to be to the east.
- MNA: The groundwater parameters obtained during the 2012 LTM event support evidence that natural attenuation of petroleum hydrocarbons continues to occur at the site.
- No free product was detected in any well at this site in 2012.
- Well 14-100: This well is located within the contaminant plume. GRO was detected at a concentration above the endpoint criteria in 2012. The concentration trend is stable at the 80 and 95 percent confidence intervals.
- Well 14-110: This well is located downgradient to the contaminant plume. GRO was detected below endpoint criteria for the seventh time since monitoring began in 2003.

**Table 11-3.** Concentration Trend Evaluation for Runway 5-23 Avgas Valve Pit

Well	Target Analyte	Exceeds Endpoint Criteria	Highest Concentration Last Two Sampling Periods (µg/L)	Endpoint Criteria <sup>1</sup> (µg/L)	Sampling Periods (n)	Mann-Kendall Statistic (S)	Mann-Kendall Trend			Sen's Slope			
							Trend at 80% C.I.	Trend at 95% C.I.	Concentration Stability <sup>2</sup>	Median Slope	Statistically Significant Trend	2-Tailed Test at 80% C.I.	
											Lower Limit	Upper Limit	
14-100	GRO	Yes	2,200 Y	1,300	10	3	No trend	No trend	Stable	NC	NC	NC	NC

Notes:

<sup>1</sup> Endpoint criteria are established from ADEC cleanup levels for groundwater used as a drinking water source.

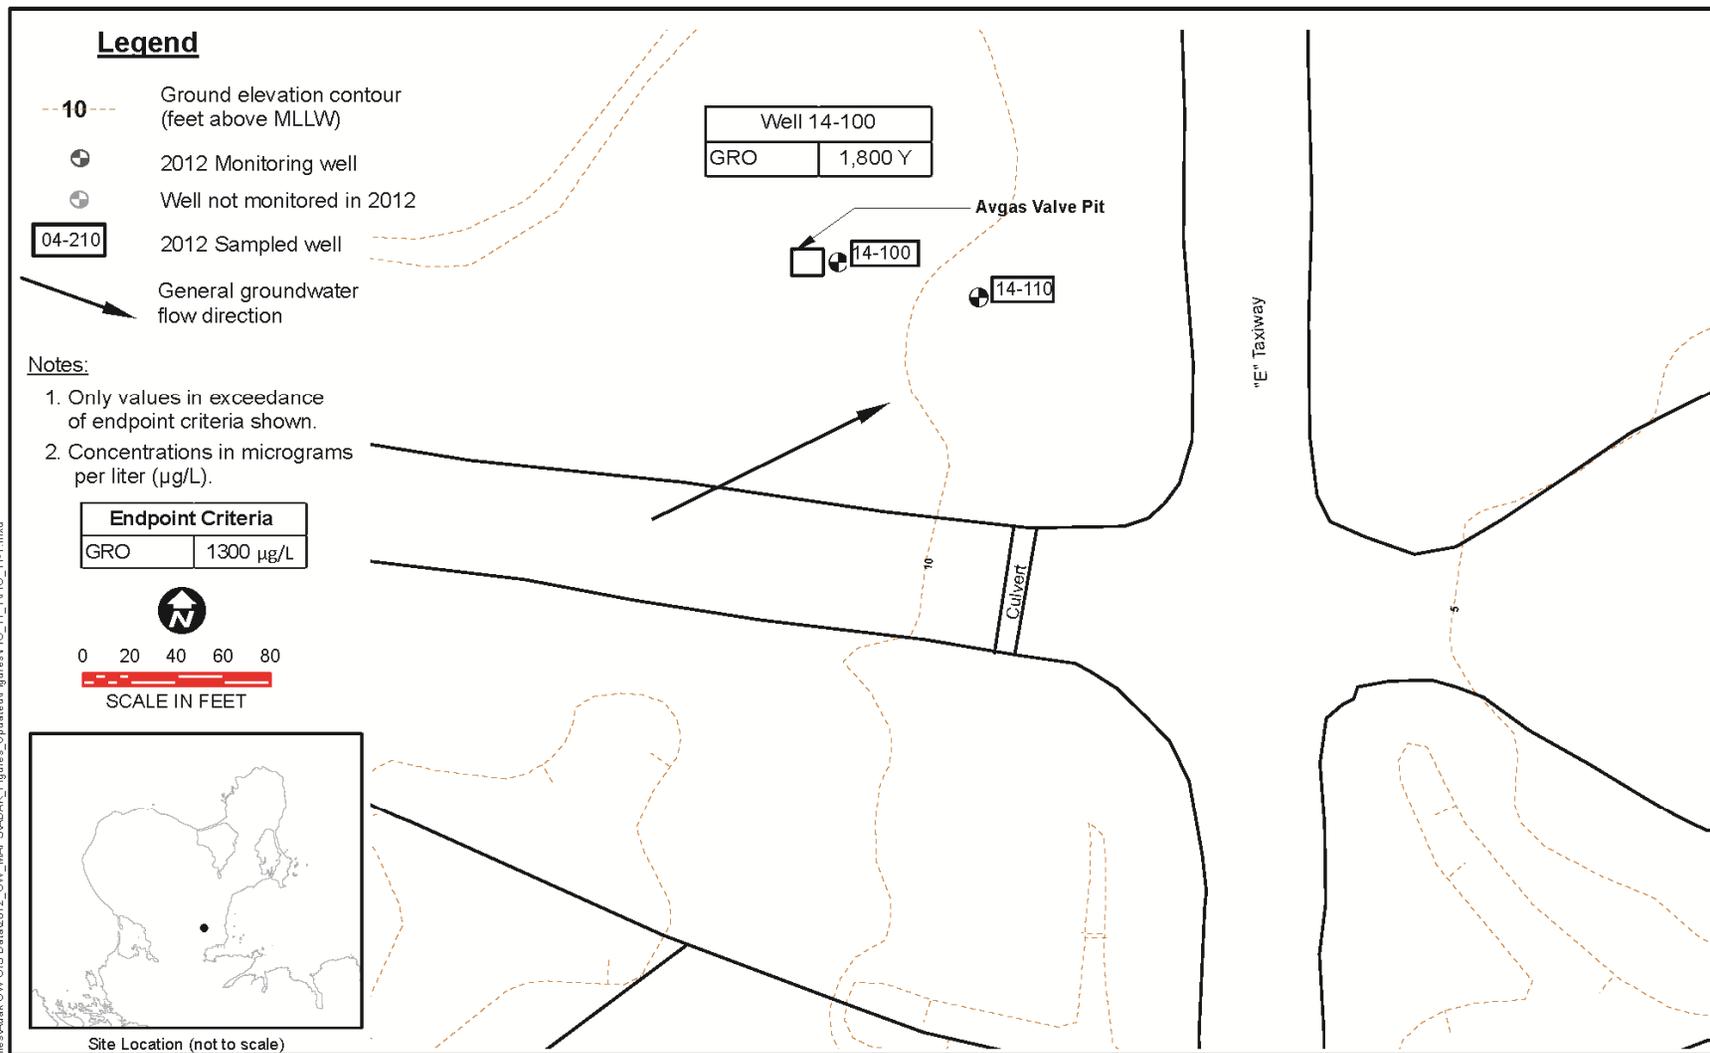

<sup>2</sup> Concentration stability is determined from the coefficient of variation when no trend exists at the 80% confidence interval (C.I.).

Sen's Slope is calculated for target analytes with decreasing concentration trends only.

## **11.6 RECOMMENDATIONS**

Since GRO has remained below endpoint criteria in well 14-110 since sampling commenced in 2003 and because concentrations of GRO are exhibiting stable concentrations, it is recommended that monitoring at this well be discontinued.

GRO remains above the endpoint criteria in well 14-100. Since no downgradient receptors exist at the site and GRO exhibits stable concentrations, it is recommended that monitoring at this site be continue to be conducted to every other year. It is recommended that monitoring be changed to every odd year with the next sampling occurring in 2013. This recommendation is consistent with CMP, Revision 5 (Navy 2012e) to align all biennial sampling to odd year sampling.

 2012 Annual Groundwater  
 Monitoring Report

## **12. SA 78, OLD TRANSPORTATION BUILDING, USTS 10583 AND 10584, AND ASTS**

This section presents the results of groundwater monitoring performed at the SA 78, Old Transportation Building, USTs 10583 and 10584, and ASTs site during 2012. The initial remedy specified for this site in the OU A ROD was free product recovery (Navy et al. 2000). MNA with ICs was selected by the Navy and ADEC as the post free product recovery remedy for this site (Navy and ADEC 2005). Surface water protection monitoring is also conducted at this site to monitor for migration of petroleum hydrocarbons toward surface water targets.

To comply with requirements specified for this remedy, the Navy conducts periodic groundwater sampling and water level/product thickness monitoring. The Final Decision Document for Petroleum Sites with No Unacceptable Risk (Navy and ADEC 2005) specifies that groundwater at this site is not reasonably expected to be a potential future source of drinking water. Groundwater samples are collected from these wells to evaluate groundwater quality relative to 10 times the Alaska groundwater cleanup levels (18 AAC 75.345), and to verify that concentrations of target analytes are not migrating to surface water protection points.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, a discussion of natural attenuation conditions, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, trend evaluation analyses for historical target analyte concentrations on data, conclusions based on these analyses, and recommendations for future monitoring activities at the site.

### **12.1 FIELD MEASUREMENTS**

Depth-to-water and product thickness measurements were collected at five wells on August 31, 2012. Table 12-1 provides the measured depths to water, the calculated groundwater elevations, and if present the product thicknesses. Figure 12-1 shows the locations of the wells at SA 78, Old Transportation Building, USTs 10583 and 10584, and ASTs, the site topography, and the interpreted groundwater flow direction which is southeast toward Clam Lagoon. Free product was not observed in any of the wells in 2012.

**Table 12-1.** 2012 Field Measurements for SA 78, Old Transportation Building, USTs 10583 and 10584, and ASTs

Well Location	Physical Measurements				Groundwater Parameters						
	Casing Elevation (ft MLLW)	Depth to Water (ft BTOC)	Groundwater Surface Elevation (ft MLLW)	Measured Product Thickness (ft)	pH (SU)	Specific Conductance (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Temperature (°C)	Salinity (%)	ORP (mV)
12-145	61.88	24.49	37.39	0	6.28	0.342	50.6	0.00	7.78	0.0	-48
12-801	35.00	3.22	31.78	0	NP	NP	NP	NP	NP	NP	NP
12-802	10.92	2.84	8.08	0	6.27	0.406	0.0	0.00	8.56	0.0	194
MW-116	44.96	14.19	30.77	0	5.16	0.275	13.6	2.67	5.85	0.0	296
MW-117	49.81	14.25	35.56	0	NP	NP	NP	NP	NP	NP	NP

*Notes:*

The reported casing elevation is the surveyed elevation residing in the NIRIS database.  
 The last groundwater parameter measurement prior to sample collection is reported.

Groundwater sampling was performed at the three scheduled monitoring wells on August 31, 2012. Field measurements were recorded on the field forms and logbooks during monitoring well sampling activities (Appendix A). Table 12-1 lists the final field measurements recorded at the monitoring wells prior to sample collection. A review of the sampling data reported for this site indicates that prior to sample collection groundwater parameters stabilized at well 12-802. Parameters did not stabilize at wells MW-116 and 12-801, therefore three times the casing volume of groundwater was removed prior to sampling per CMP Revision 5 (Navy 2012e). The 2012 analytical results in these wells are consistent with past analytical results and appear to be unaffected by the lack of stabilization.

Because free product was observed in surface water protection well 12-802 in 2009, a visual inspection of Clam Lagoon shoreline between wells 12-801 and 12-802 was conducted in 2012. The purpose of the inspection was to identify groundwater or petroleum seeps on the shoreline, or sheens on the surface water of Clam Lagoon. No seeps, sheens, odors, or discolorations were observed during the shoreline inspection. Surface water protection surface water/sediment sampling was to be performed at this location if contamination was observed during the inspection. Since no contamination was observed, this sampling was not performed. Shoreline inspection and results are summarized in Section 4.

## **12.2 TARGET ANALYTE RESULTS**

The groundwater samples collected from wells 12-145 and 12-802 were analyzed for DRO, GRO, and benzene. Well MW-116 was analyzed for DRO only. Table 12-2 presents the historical analytical results for all site monitoring wells. The historical analytical results obtained for these locations are also summarized in Appendix C. Laboratory forms presenting the 2012 results are provided in Appendix F. Figure 12-1 shows the locations of the site wells.

DRO, GRO, and benzene were detected below their respective endpoint criteria of 15,000 µg/L, 13,000 µg/L, and 50 µg/L in samples collected from wells 12-145 and 12-802, and DRO was also detected below its endpoint criteria in the sample collected from well MW-116 at the SA 78, Old Transportation Building site during 2012.

## **12.3 MONITORED NATURAL ATTENUATION**

NAPs were collected at this site in 2009 to determine if natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data indicated that biodegradation of petroleum hydrocarbons is likely occurring by iron (II) reduction; sulfate reduction; and strong evidence of methanogenesis as shown by elevated ferric iron

concentration, depleted sulfates, and elevated methane concentrations in comparison to background conditions. Groundwater parameters presented in Table 12-1 collected during the 2012 LTM event support evidence of continued natural attenuation as shown by the reducing environment (negative ORP) and depleted dissolved oxygen (0.0 mg/L) at the site. A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

**Table 12-2.** Analytical Results for Petroleum-Related Chemicals for SA 78, Old Transportation Building, USTs 10583 and 10584, and ASTs

Well Location	Year	DRO (µg/L)	GRO (µg/L)	Benzene (µg/L)

	2008	27 J	100 U	0.50 U
	2009	NP	NP	NP
	2010	26 J	100 U	0.50 U
	2012	12 J	100 U	0.50 U
MW-116 Downgradient	2002	77 J	12 J	1.0 U
	2005	238 U	24.8 J	0.50 U
	2006	84 U	25 U	1.0 U
	2007	97 Z	100 U	0.50 U
	2009	100 Y	100 U	0.50 U
	2010	28 J	NP	NP
	2012	24 J	NP	NP
Endpoint Criteria <sup>1</sup>		15,000	13,000	50

Notes:

<sup>1</sup> The endpoint criteria are 10 times ADEC cleanup levels because groundwater is not expected to be used for drinking water.

**Bold** indicates reported concentration is greater endpoint criteria.

## 12.4 TREND EVALUATION

Statistical trend evaluations were conducted for target analyte concentrations in groundwater in accordance with the CMP, Revision 5 (Navy 2012e). Trend evaluation was conducted for only analytes that exceeded the endpoint criteria within the last two sampling events and had a minimum of four data points. Therefore, no statistical trends were performed for this site in 2012.

## 12.5 CONCLUSIONS

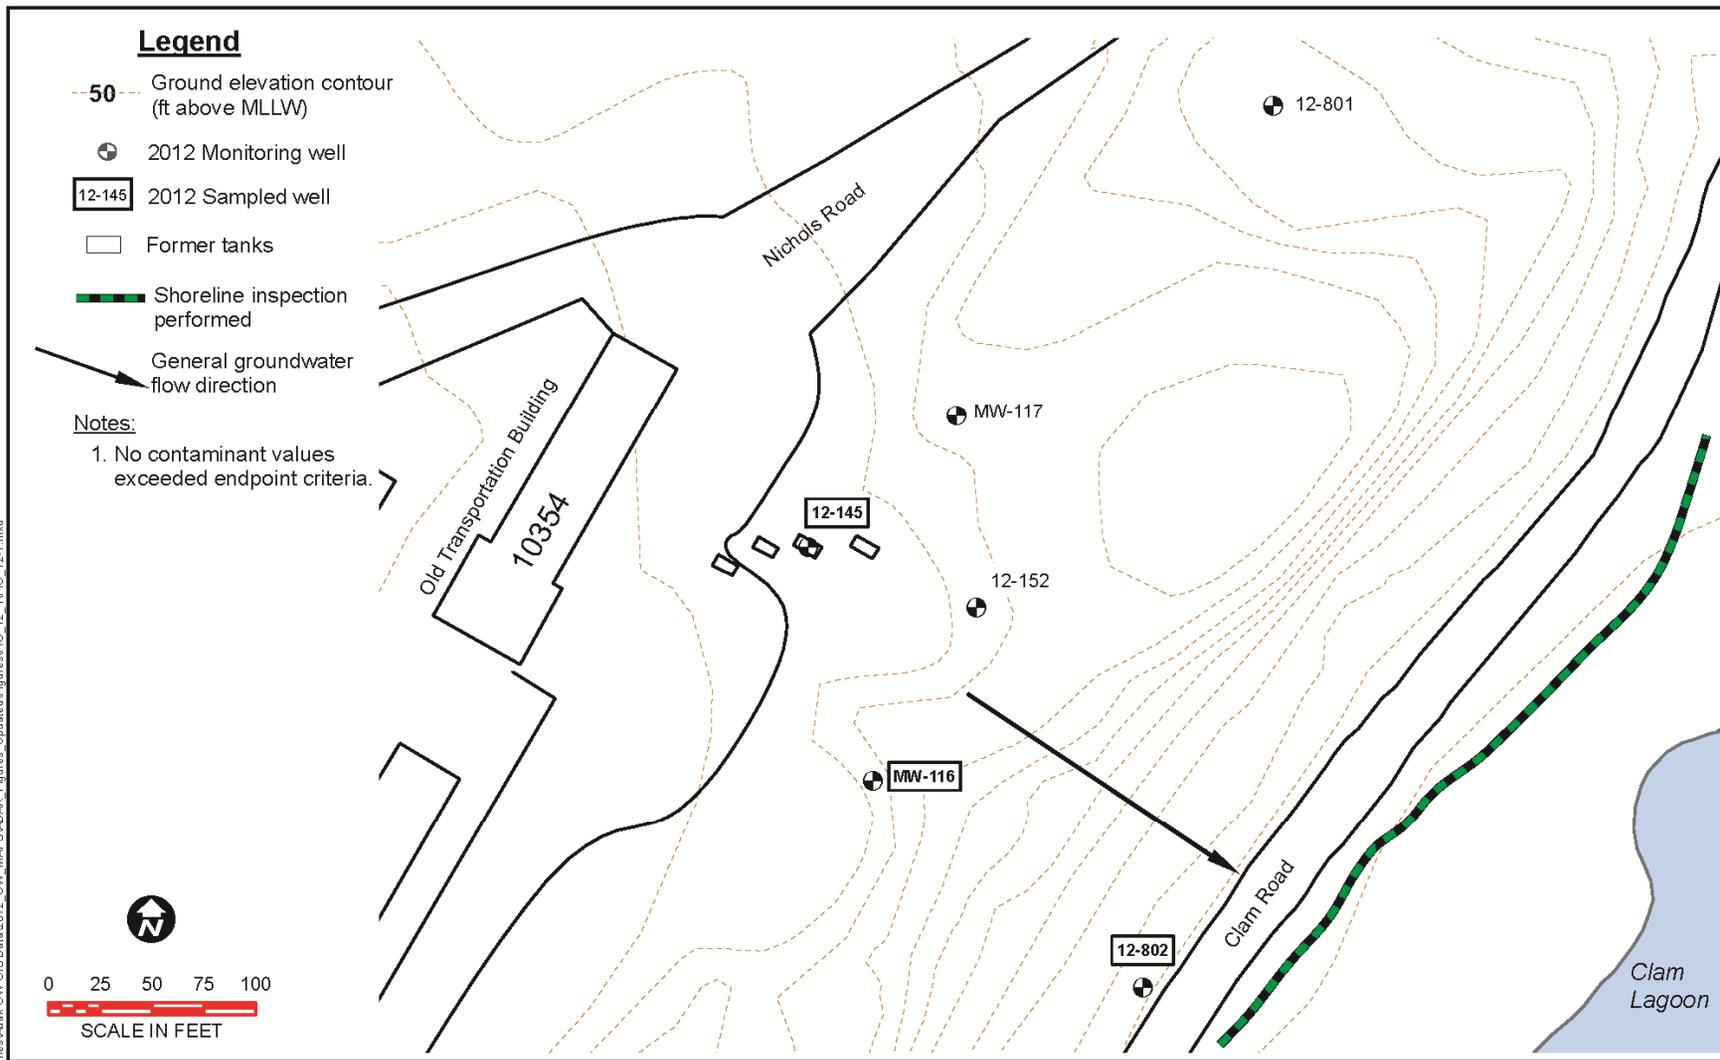

This section presents the conclusions based on a review of groundwater monitoring results performed at SA 78, Old Transportation Building, USTs 10583 and 10584, and ASTs in 2012. The conclusions are as follows:

- Groundwater Flow: The groundwater flow direction in 2012 at the site is interpreted to be southeast toward Clam Lagoon.
- MNA: The groundwater parameters obtained during the 2012 LTM event support evidence that natural attenuation of petroleum hydrocarbons continues to occur at the site.
- No free product was detected in any well at this site in 2012.
- Well 12-145: DRO, GRO, and benzene were below their respective endpoint criteria in 2010 and have been below endpoint criteria for three consecutive sampling events.
- Well MW-116: DRO has been below its respective endpoint criteria since sampling began in 2002 for seven consecutive sampling events.
- Well 12-802: Surface water protection monitoring is conducted at this well. DRO, GRO, and benzene have been below their respective endpoint criteria since sampling began in 2004 for six consecutive sampling events.
- A shoreline inspection that was performed downgradient of the site did not reveal any evidence of petroleum contamination.

## 12.6 RECOMMENDATIONS

Onsite groundwater DRO, GRO, and benzene concentrations have been below their respective endpoint criteria since for at least three consecutive sampling events. Strong evidence of natural attenuation was shown to be occurring in onsite groundwater in 2009 and data supporting the continuation of natural attenuation was again observed in 2010. No free product has been observed in any site well since 2009 and no evidence of petroleum contamination has been observed during any shoreline inspection. Based on these observations, it is recommended that monitoring at this site be discontinued and that the site be recommended for closure.

12-6

 2012 Annual Groundwater  
 Monitoring Report

### **13. SA 79, MAIN ROAD PIPELINE, SOUTH END**

This section presents the results of groundwater monitoring performed at SA 79, Main Road Pipeline, South End during 2012. Limited groundwater monitoring is the OU A ROD-specified remedy for the south end of the site (Navy et al. 2000). The north end of the site achieved endpoint criteria and received closure from ADEC in 2004; however, the south end did not achieve limited groundwater monitoring endpoint criteria and was reverted to a natural attenuation evaluation. To comply with requirements specified for these remedies, the Navy conducts periodic groundwater sampling and water level/product thickness monitoring. Groundwater samples are collected from these wells to evaluate groundwater quality relative to ADEC groundwater cleanup levels (18 AAC 75.345), to determine whether natural attenuation is occurring at the south end of the site, and to monitor for surface water protection.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, a discussion of natural attenuation conditions, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, trend evaluation analyses for historical target analyte concentration data, conclusions based on these analyses, and recommendations for future monitoring activities at the site.

#### **13.1 FIELD MEASUREMENTS**

The monitoring wells completed at this site were gauged and sampled. Depth-to-water and product thickness measurements were collected at three monitoring wells on August 27, 2012 (Table 13-1). Well 02-230 was monitored for surface water protection purposes. Figure 13-1 shows the location of monitoring wells, land surface topography, and Sweeper Cove. Table 13-1 provides the measured depths to water and the calculated groundwater elevations. Based on the analysis of historical water level measurements and the hydrogeologic setting of the site, the groundwater flow direction is to the east-southeast toward Sweeper Cove. Measurable free product was not observed in any of the wells in 2012.

Field measurements were recorded on field forms during monitoring well sampling activities (Appendix A). Table 13-1 lists the final field measurements recorded at each monitoring well prior to sample collection. A review of the sampling data reported for this site indicates that prior to sample collection groundwater parameters stabilized in all wells.

**Table 13-1.** 2012 Field Measurements for SA 79, Main Road Pipeline, South End

Well Location	Physical Parameters				Groundwater Parameters						
	Casing Elevation (ft MLLW)	Depth to Water (ft BTOC)	Groundwater Surface Elevation (ft MLLW)	Measured Product Thickness (ft)	pH (SU)	Specific Conductance (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Temperature (°C)	Salinity (%)	ORP (mV)
02-230	13.69	12.48	1.21	0	6.20	0.648	12	0.00	7.13	0.0	-79
601	13.77	11.68	2.09	0	6.11	0.350	3	0.00	7.65	0.0	-50
MRP-MW8	12.72	11.21	1.51	0	6.09	0.439	5	0.00	7.18	0.0	-71

*Notes:*

The reported casing elevation is the surveyed elevation residing in the NIRIS database.  
 The last groundwater parameter measurement prior to sample collection is reported.

Because DRO concentrations in groundwater samples collected from wells 02-230 and MRP-MW8 have been greater than the endpoint criteria (1,500 µg/L) since 2001, a visual inspection of the shoreline from well MRP-MW8 to the mouth of South Sweeper Creek was conducted in 2012. The purpose of the inspection was to identify groundwater or petroleum seeps on the shoreline, or sheens on the surface water of Sweeper Cove. No seeps, sheens, odors, or discolorations were observed during the shoreline inspection. Shoreline inspection and results are summarized in Section 4.1.3.

### **13.2 TARGET ANALYTE RESULTS**

The groundwater samples collected from all wells were analyzed for DRO. Figure 13-1 shows the locations of the wells sampled and the analytical results that exceed the applicable endpoint criteria. Table 13-2 presents the analytical results. The historical analytical results obtained for these locations are summarized in Appendix C. Laboratory forms presenting the 2012 results are provided in Appendix F.

DRO was detected above the endpoint criteria (1,500 µg/L) in samples collected from wells MRP-MW8 (3,900 µg/L), 601 (1,800 µg/L), and 02-230 (3,200 µg/L).

### **13.3 MONITORED NATURAL ATTENUATION**

NAPs were collected at this site in 2009 to determine whether natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data indicated that biodegradation of petroleum hydrocarbons is possibly occurring by aerobic digestion; iron (II) reduction; and weak evidence of methanogenesis as indicated by reduced dissolved oxygen levels, weakly elevated ferric iron concentrations, and slightly elevated methane concentrations in comparison to background conditions. Groundwater parameters collected during the 2012 LTM event, which are presented in Table 13-1, support evidence of continued natural attenuation as shown by the reducing environment (negative ORP) and depleted dissolved oxygen (0.0 mg/L) within the plume at the site. A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

### **13.4 TREND EVALUATION**

Statistical trend evaluations were conducted for target analyte concentrations in groundwater in accordance with the CMP, Revision 5 (Navy 2012e). Trend evaluation was conducted for only analytes that exceeded the endpoint criteria within the last two sampling events and had a minimum of four data points. The results for the trend evaluation performed for this site are summarized in Table 13-3. Worksheets and graphs are provided in Appendix H.

**Table 13-2.** Analytical Results for Petroleum-Related Chemicals for SA 79, Main Road Pipeline, South End

<b>Well Location</b>	<b>Year</b>	<b>DRO (µg/L)</b>
MRP-MW8	2001	<b>2,790</b>
Plume Source Area	2002	<b>2,700</b>
	2003	<b>3,600</b>
	2004	<b>3,890</b>
	2005	<b>3,700</b>
	2006	<b>4,300</b>
	2007	<b>4,700 Y</b>
	2008	<b>3,400 Y</b>
	2009	<b>3,000 Y</b>
	2010	<b>2,700 Y</b>
	2011	<b>3,700 Y</b>
	2012	<b>3,900 Y</b>
601	2011	<b>2,100 Y</b>
Plume Source Area	2012	<b>1,800 Y</b>
02-230	2001	<b>4,230</b>
Surface Water Protection Well	2002	<b>3,500</b>
	2003	<b>3,900</b>
	2004	<b>5,760</b>
	2005	<b>4,060 J</b>
	2006	<b>5,500</b>
	2007	<b>4,800 Y</b>
	2008	<b>5,000 Y</b>
	2009	<b>2,400 Y</b>
	2010	<b>4,000 Y</b>
	2011	<b>4,200 Y</b>
	2012	<b>3,200 Y</b>
	Endpoint Criteria	

*Note:*  
**Bold** indicates reported concentration is greater than the endpoint criteria.

The following are the results of the statistical evaluation:

- Well MRP-MW8: The DRO concentration is stable with no trend at the 80 or 95 percent confidence intervals.
- Well 02-230: The Mann-Kendall evaluation for the DRO concentration shows a decreasing trend at the 80 percent confidence level. However the Sen's evaluation does not indicate that this trend is statistically significant.

### 13.5 CONCLUSIONS

This section presents the conclusions based on groundwater monitoring conducted at the SA 79, Main Road Pipeline, South End site in 2012. The conclusions are as follows:

- **Groundwater Flow Direction:** The hydrogeologic setting of the site and the limited water level elevation data indicate that the groundwater flow direction is to the east toward Sweeper Cove.
- **MNA:** The groundwater parameters obtained during the 2012 LTM event provides evidence that natural attenuation of petroleum hydrocarbons is occurring at the site.
- **No measurable free product** was detected in any site well.
- **Well MRP-MW8:** This well is located within the contaminant plume. DRO has been detected above the endpoint criteria since 2001. The trend evaluation performed on the DRO data collected between 2001 and 2012 exhibits no trend at the 80 and 95 percent confidence intervals.
- **Well 02-230:** This well is located within the contaminant plume. DRO has been detected above the endpoint criteria since 2001. The trend evaluation performed on the DRO collected between 2001 and 2012 exhibits decreasing concentrations at the 80 percent confidence interval but no trend at the 95 percent confidence interval. Sen's slope indicates that the decreasing trend is not statistically significant.
- **Well 601:** This well is located within the contaminant plume. DRO has remained above the endpoint criteria since 2011 when sampling was initiated (two consecutive sampling events).
- A shoreline inspection in Sweeper Cove downgradient of the site revealed no evidence of petroleum contamination.

### 13.6 RECOMMENDATIONS

Because of the observed exceedances of DRO above endpoint criteria in wells MRP-MW8, 02-230, and 601, the continued monitoring of DRO is recommended. However, since DRO concentrations are exhibiting decreasing trends and stable concentrations, it is recommended that monitoring at this site be reduced to every odd year with the next sampling occurring in 2013. This recommendation is consistent with CMP, Revision 5 (Navy 2012e) to align all biennial sampling to odd year sampling.

**Table 13-3.** Concentration Trend Evaluation for SA 79, Main Road Pipeline, South End

Well	Target Analyte	Exceeds Endpoint Criteria	Highest Concentration Last Two Sampling Periods (µg/L)	Endpoint Criteria <sup>1</sup> (µg/L)	Sampling Periods (n)	Mann-Kendall Statistic (S)	Mann-Kendall Trend			Sen's Slope			
							Trend at 80% C.I.	Trend at 95% C.I.	Concentration Stability <sup>2</sup>	Median Slope	Statistically Significant Trend	2-Tailed Test at 80% C.I.	
											Lower Limit	Upper Limit	
MRP-MW8	DRO	Yes	3,900 Y	1,500	10	-4	No trend	No trend	Stable	NC	NC	NC	NC
02-230	DRO	Yes	4,200 Y	1,500	10	-13	Decreasing	No trend	NA	-60.1	No	-229	77.8

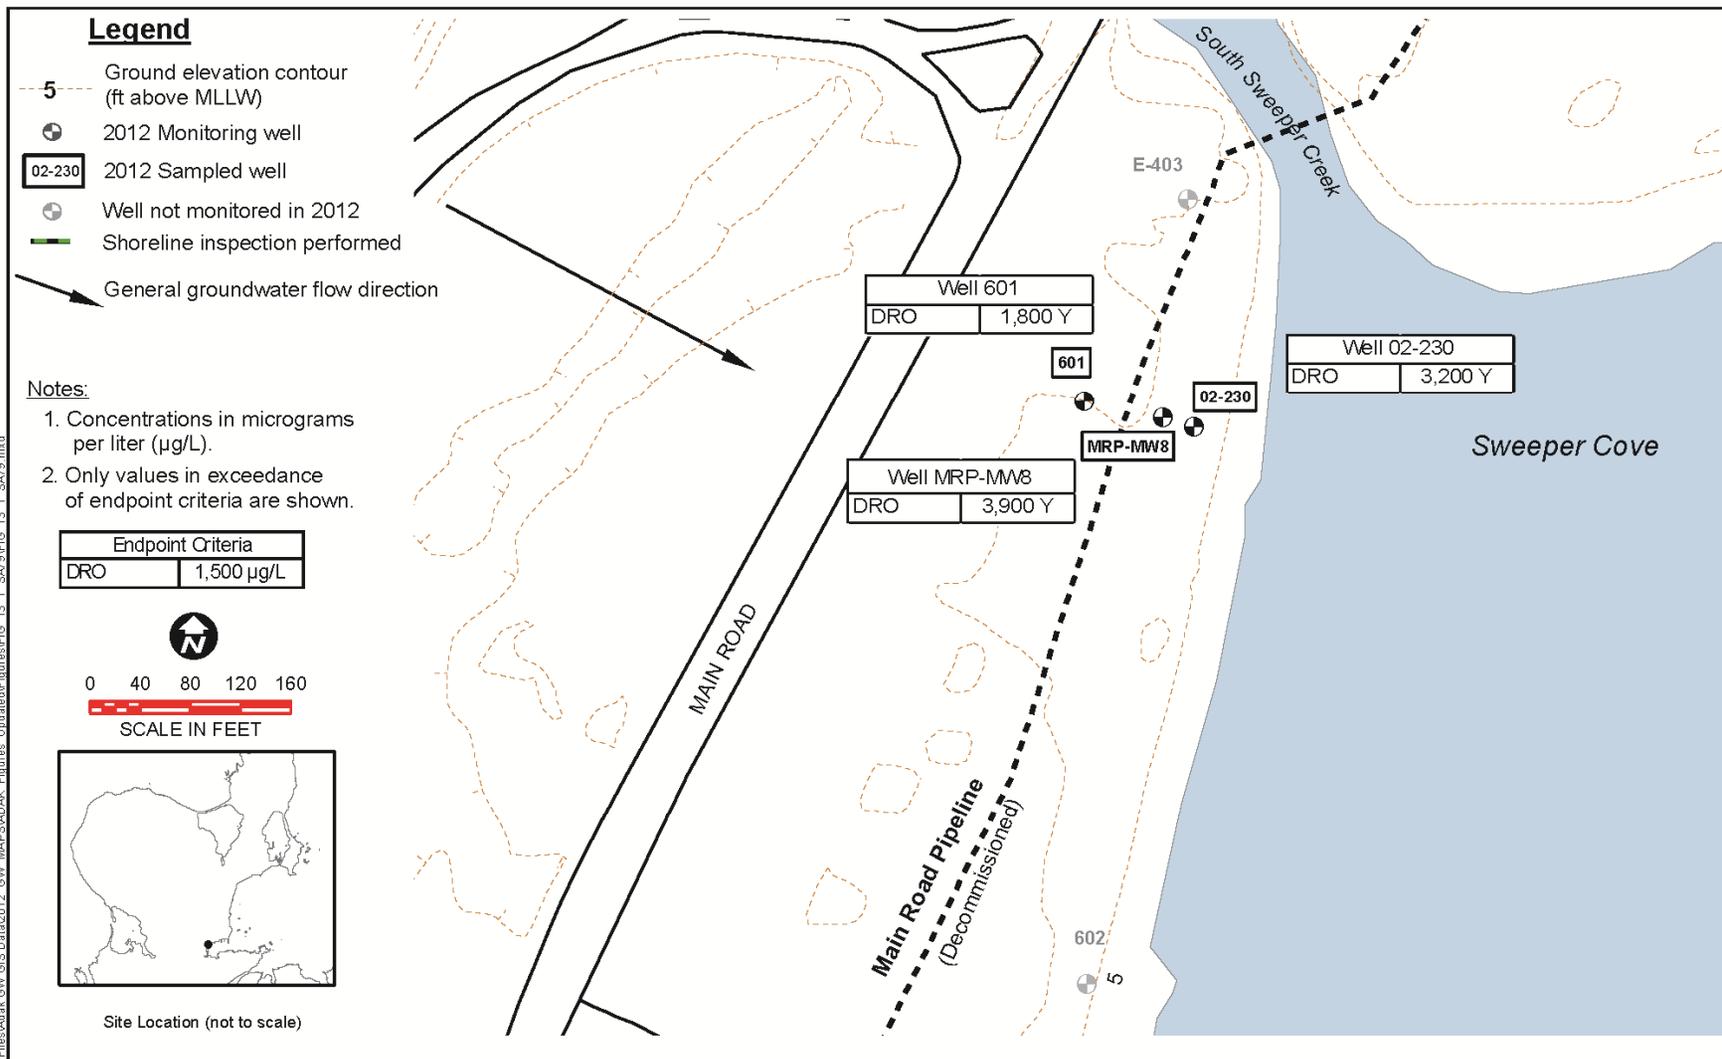

Notes:

<sup>1</sup>Endpoint criteria are established from ADEC cleanup levels for groundwater used as a drinking water source.

<sup>2</sup>Concentration stability is determined from the coefficient of variation when no trend exists at the 80% confidence interval (C.I.).

Sen's Slope is calculated for target analytes with decreasing concentration trends only.

----------------------------------	---	---

## **14. SA 80, STEAM PLANT 4, USTS 27089 AND 27090**

This section presents the results of groundwater monitoring performed at SA 80, Steam Plant 4, USTs 27089 and 27090 during 2012. The remedy specified for this site in the OU A ROD is free product recovery (Navy et al. 2000). The Navy and ADEC have selected MNA with ICs as the post-free product recovery remedy for this site (Navy and ADEC 2005). To comply with requirements specified for these remedies, the Navy conducts annual groundwater sampling and water level/product thickness monitoring.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, a discussion of natural attenuation conditions, an interpretation of groundwater flow direction based on water levels, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, trend evaluation analyses for historical target analyte concentration data, conclusions based on these analyses, and recommendations for future monitoring activities at the site.

### **14.1 FIELD MEASUREMENTS**

Depth-to-water and product thickness measurements were collected at nine monitoring wells on September 1, 2012. Table 14-1 presents the depth-to-water measurements (corrected for product thickness, if present), the calculated groundwater elevations, and if present the product thicknesses. Groundwater elevations have been corrected for the presence of free product in those wells with detectable thickness (Appendix D). Figure 14-1 shows the location of the wells, the site topography and features, and the interpreted groundwater flow direction.

A shallow perched aquifer zone has been identified to occur in the area of the removed USTs (Navy 2004). Three wells monitored in 2012 (04-155, 04-173, and SP4-2) have shallow water levels that represent this perched zone. The water level data from the remaining wells that are representative of the regional aquifer indicate that the direction of groundwater flow is to the west-southwest, toward East Canal.

Sampling was conducted at five monitoring wells on September 3 and 4, 2012. Field measurements were recorded on the field forms and in the logbooks during monitoring well sampling activities (Appendix A). Table 14-1 lists the final field measurements recorded at each monitoring well prior to sample collection.

**Table 14-1.** 2012 Field Measurements for SA 80, Steam Plant 4, USTs 27089 and 27090

Well Location	Physical Measurements				Groundwater Parameters						
	Casing Elevation (ft MLLW)	Depth to Water (ft BTOC)	Groundwater Surface Elevation (ft MLLW)	Measured Product Thickness (ft)	pH (SU)	Specific Conductance (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Temperature (°C)	Salinity (%)	ORP (mV)
04-155	27.77	15.98	11.79	0	NP	NP	NP	NP	NP	NP	NP
04-157	28.18	19.22	8.96	Trace	NP	NP	NP	NP	NP	NP	NP
04-158	27.36	19.08	8.28	0	6.03	0.462	70.6	0.00	7.74	0	-31
04-159	29.86	23.21	6.65	0	6.51	0.480	16.0	1.70	6.73	0	-107
04-164	28.51	21.83	6.68	0	NP	NP	NP	NP	NP	NP	NP
04-173	27.46	14.60	12.86	Trace	6.19	0.409	9	0.00	6.05	0.0	-45
04-801	27.76	21.32	6.44	0	5.63	0.239	22	6.07	6.14	0.0	219
SP4-2	27.23	14.34	12.89	0	NP	NP	NP	NP	NP	NP	NP
SP4-3	26.70	20.03	6.67	0	6.30	0.481	124	0.00	6.24	0.0	-63

*Notes:*

<sup>1</sup> Corrected for presence of product in the well.

The reported casing elevation is the surveyed elevation residing in the NIRIS database.

The last groundwater parameter measurement prior to sample collection is reported.

14-2

A review of the sampling data reported for this site indicates that, prior to sample collection, groundwater parameters stabilized in wells 04-158, 04-173, and SP4-3 but not in wells 04-159 and 04-801. Therefore, three casing volumes of groundwater were removed from these wells prior to sampling per CMP Revision 5 (Navy 2012e). The 2012 analytical results in these wells are consistent with past analytical results and appear to be unaffected by the lack of stabilization.

No measurable free product was observed in any of the nine wells. Trace product was seen in wells 04-157 and 04-173 (Table 14-1) during the 2012 LTM field event. Monthly free product recovery activities were performed at this site during October 2011 through September 2012. A total of 2.09 gallons was recovered from site wells during this time period. The monthly free product recovery activities are summarized in Appendix J.

#### **14.2 TARGET ANALYTE RESULTS**

Groundwater samples were collected from wells 04-158, 04-159, 04-173, and 04-801 in 2012 and analyzed for DRO. Figure 14-1 shows the location of the wells and the analytical results that exceeded the endpoint criteria. Table 14-2 presents the results of these analyses. The historical analytical results obtained for these locations are summarized in Appendix C. Laboratory reports presenting the 2012 results are provided in Appendix F.

DRO was detected above the endpoint criteria (1,500 µg/L) in samples collected from wells 04-158 (8,700 µg/L), 04-159 (3,200 µg/L), 04-173 (3,900 µg/L), and SP4-3 (3,500 µg/L). DRO in the sample from well 04-801 was detected below endpoint criteria at 16 µg/L.

#### **14.3 MONITORED NATURAL ATTENUATION**

NAPs were collected at this site in 2009 to determine whether natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data strongly indicated that biodegradation of petroleum hydrocarbons is likely occurring by iron (II) reduction; sulfate reduction; and methanogenesis as shown by elevated ferric iron concentrations, strongly depleted sulfates, and strongly elevated methane concentrations in comparison to background conditions. Groundwater parameters presented in Table 14-1 collected during the 2012 LTM event supports evidence of continued natural attenuation as shown by the reducing environment (negative ORP) and depleted dissolved oxygen (ranging from 0.0 mg/L to 1.70 mg/L) within the plume at the site. A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

**Table 14-2.** Analytical Results for Petroleum-Related Chemicals for SA 80, Steam Plant 4, USTs 27089 and 27090

	Endpoint Criteria	

Notes:

**Bold** indicates reported concentration is greater than the endpoint criteria.

#### 14.4 TREND EVALUATION

Statistical trend evaluations were conducted for target analyte concentrations in groundwater in accordance with the CMP, Revision 5 (Navy 2012e). Trend evaluation was conducted for only analytes that exceeded the endpoint criteria within the last two sampling events and had a minimum of four data points. Results of the trend evaluation performed for this site are summarized in Table 14-3. Worksheets and graphs are provided in Appendix H.

The following are the results of the statistical evaluation:

- Well 04-159: The DRO concentration is stable with no trend at the 80 or 95 percent confidence intervals.
- Well SP4-3: The DRO concentration is stable with no trend at the 80 or 95 percent confidence intervals.

#### 14.5 CONCLUSIONS

This section presents conclusions based on a review of groundwater monitoring performed at the SA 80, Steam Plant 4, USTs 27089 and 27090 sites in 2012. The conclusions are as follows:

- Groundwater Flow: Based on the field measurements in September 2012, the interpreted groundwater flow direction in the regional aquifer is west-southwest toward the East Canal.

**Table 14-3.** Concentration Trend Evaluation for SA 80, Steam Plant 4, USTs 27089 and 27090

Well	Target Analyte	Exceeds Endpoint Criteria	Highest Concentration Last Two Sampling Periods (µg/L)	Endpoint Criteria <sup>1</sup> (µg/L)	Sampling Periods (n)	Mann-Kendall Statistic (S)	Mann-Kendall Trend			Sen's Slope			
							Trend at 80% C.I.	Trend at 95% C.I.	Concentration Stability <sup>2</sup>	Median Slope	Statistically Significant Trend	2-Tailed Test at 80% C.I.	
											Lower Limit	Upper Limit	
04-159	DRO	Yes	5,000 Y	1,500	8	4	No trend	No trend	Stable	NC	NC	NC	NC
SP4-3	DRO	Yes	5,700 Y	1,500	8	-2	No trend	No trend	Stable	NC	NC	NC	NC

*Notes:*

<sup>1</sup> Endpoint criteria are established from ADEC cleanup levels for groundwater used as a drinking water source.

<sup>2</sup> Concentration stability is determined from the coefficient of variation when no trend exists at the 80% confidence interval (C.I.).

Sen's Slope is calculated for target analytes with decreasing concentration trends only.

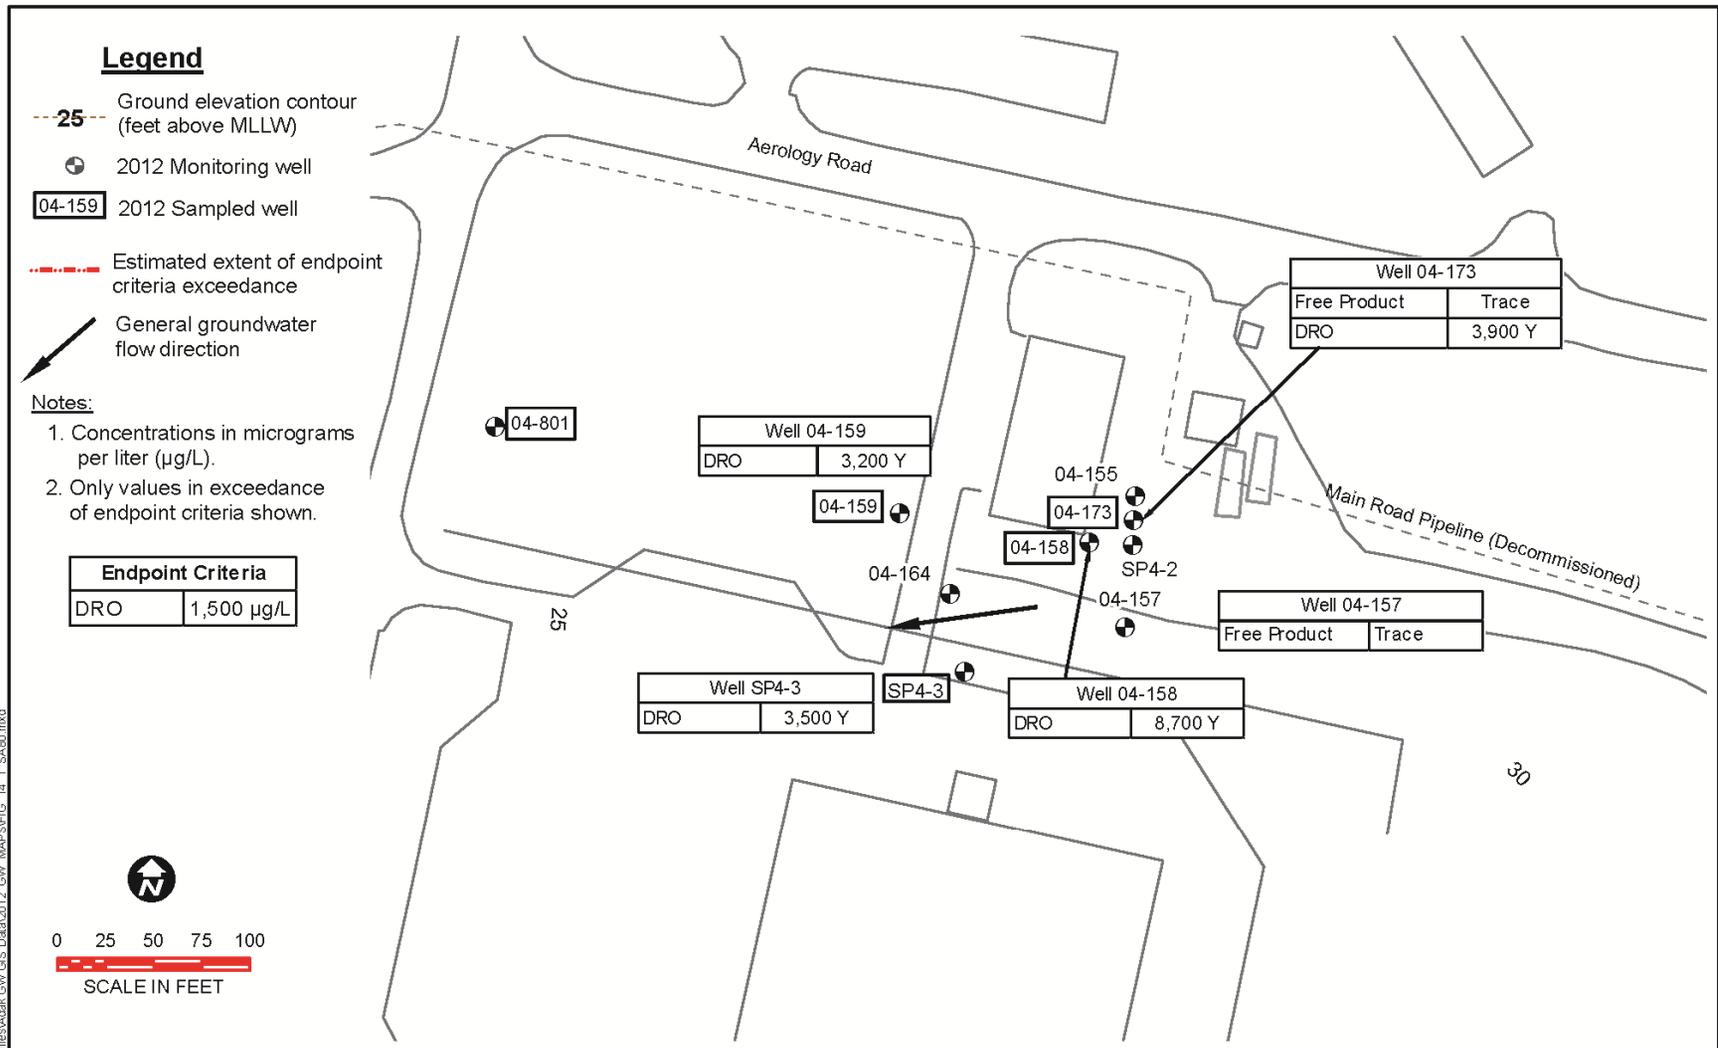

- MNA: The groundwater parameters obtained during the 2012 LTM event provide evidence that natural attenuation of petroleum hydrocarbons continues to occur at the site.
- Wells 04-157 and 04-173: Free product was detected in these wells in trace amounts.
- Well 04-158: This well is located within the contaminant plume. Free product was not detected in this well in 2012 but DRO exceeded endpoint criteria.
- Well 04-159: This well is located within the contaminant plume. DRO continued to be detected above the endpoint criteria (since 2006). As indicated by statistical analysis of data collected between 2005 and 2012, DRO concentrations have stabilized in this well. In 2011, the concentration exhibited an increasing trend.
- Well 04-173: This well is located within the contaminant plume. Free product was not detected in this well in 2012 but DRO exceeded endpoint criteria.
- Well 04-801: This well is located downgradient of the contaminant plume. DRO was detected at an estimated concentration below the laboratory reporting limit in this downgradient well in 2012 and has remained below the endpoint criteria since sampling began in 2005 (eight consecutive sampling events).
- Well SP4-3: This well is located within the contaminant plume. DRO was detected at concentrations above endpoint criteria in 2012 for the second consecutive sampling event. As indicated by statistical analysis of data collected between 2003 and 2012, DRO concentrations have stabilized in this well.

## 14.6 RECOMMENDATIONS

Because DRO has exhibited stable concentrations in groundwater at this site and because DRO has not exceeded endpoint criteria for eight consecutive sampling events, it is recommended that monitoring at well 04-801 be discontinued.

Because measurable product has not been observed in well SP4-2 since 2006, it is recommended that monitoring at this location be discontinued.

Additionally, it is recommended that monitoring at this site be reduced to every odd year with the next sampling to occur in 2013 since DRO is exhibiting stable concentrations. This recommendation is consistent with CMP, Revision 5 (Navy 2012e) to align all biennial sampling to odd year sampling.

 2012 Annual Groundwater  
 Monitoring Report

## **15. SOUTH OF RUNWAY 18-36 AREA**

This section presents the results of groundwater monitoring performed at the South of Runway 18-36 Area site during 2012. The remedy specified for this site in the OU A ROD is Free Product Recovery (Navy et al. 2000). ICs, product recovery, and MNA were established as remedies in the Final Decision Document South of Runway 18-36 Area, August 2006 (Navy 2006a). In addition, natural recovery was selected for surface water and sediment in South Sweeper Creek at this site. The LTM program for this site was initially proposed in a technical memorandum in 2006 (Navy 2006c). Annual monitoring under the LTM program for 2012 includes groundwater sampling, water level/product thickness monitoring, sediment sampling, and surface water sampling. The Final Decision Document for the South of Runway 18-36 (Navy 2006a) specifies that groundwater at this site is not reasonably expected to be a potential future source of drinking water. Groundwater samples are collected from these wells to evaluate groundwater quality relative to 10 times the ADEC Table C values (18 AAC 75.345) and to monitor for surface water protection and natural recovery.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, an interpretation of the groundwater flow direction based on water levels, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, trend evaluation analyses for historical target analyte concentration data, conclusions based on these analyses, and recommendations for future monitoring activities at the site.

### **15.1 FIELD MEASUREMENTS**

Depth-to-water and product thickness measurements were collected at 16 monitoring wells on August 27, 2012. Table 15-1 provides the measured depths to water, the calculated groundwater elevations, and if present the product thicknesses. Groundwater elevations have been corrected for the presence of free product in those wells with detectable thickness (Appendix D). Measurable free product was detected in two wells during the 2012 LTM field event: E-216 at a product thickness of 0.43 feet; and well RW-18/36-04 at a product thickness of 0.06 feet.

**Table 15-1.** 2012 Field Measurements for South of Runway 18-36 Area

Well Location	Physical Measurements				Water Quality Parameters

*Notes:*

<sup>1</sup> Corrected for presence of free product in the well.  
 The reported casing elevation is the surveyed elevation residing in the NIRIS database.  
 The last groundwater parameter measurement prior to sample collection is reported.

15-2

Figure 15-1 shows the location of the monitoring wells, the site topography, and the interpreted groundwater flow direction, and the downgradient surface water bodies (South Sweeper Creek and Sweeper Cove). The water level data indicate that the groundwater flows primarily west onto the site and then spreads radially to discharge into adjacent surface water bodies: north to Crossover Canal and West Canal, west to South Sweeper Creek, and southwest to Sweeper Cove. The potentiometric surface recorded for this sampling event is similar to previous studies.

Three monitoring wells, two surface water locations, and three sediment sampling locations were sampled between August 27 and September 8, 2012. Surface water protection monitoring was performed at three well locations (02-231, 02-232, and AS-1). Field measurements were recorded in the field forms and logbooks during sampling activities (Appendix A). Table 15-1 lists the final field measurements recorded at each monitoring well and surface water location prior to sample collection. A review of the sampling data reported for this site indicates that prior to sample collection all wells, except for well 02-231, exhibited groundwater parameters that stabilized to within specified criteria. Therefore, three casing volumes of groundwater were removed from well 02-231 prior to sampling per CMP Revision 5 (Navy 2012e). The 2012 analytical results in this well are consistent with past analytical results and appear to be unaffected by the lack of stabilization.

Monthly free product recovery activities were performed at this site during contract year 2011/2012 (October through September). Because product recovery endpoints were met, product recovery activities were discontinued in February 2012 as recommended in the Remedial Action Summary Report, Free Product Recovery, Adak (Navy 2012f).

Visual inspections of the eastern South Sweeper Creek shoreline were conducted between surface water/sediment locations NSWSD-08 and NSWSD-07 to identify evidence of visible petroleum contamination. One small area of black-stained sediment (4 ft by 2 ft) was observed just south of the Moffett Road Bridge. Several sections of the shoreline downgradient of the site contained black-stained sediment just beneath the soil surface which released sheen when disturbed. Oily sediments, petroleum sheen, and odor were observed along the shoreline adjacent to South of Runway 18-36 Area during sediment sampling at locations NSWSD-2 and NSWSD-05 at approximately a quarter to a half inch below the sediment surface. For the first time since sampling commenced at this location, no visible petroleum contamination was observed at NSWSD-4. However, DRO concentrations in all three of these sediment samples still exceeded endpoint criteria in 2012. No visible contamination was observed at either surface water sample NSWSD-07, collected at the mouth of South Sweeper Creek, or NSWSD-08, collected north and upstream of the site. Results of the visual shoreline inspections are summarized in Section 4.1.3.

## **15.2 TARGET ANALYTE RESULTS**

The following sections describe the analytical results for each medium sampled in 2012. Figure 15-1 illustrates the location of the wells sampled, the surface water/sediment locations, and the analytical results above the endpoint criteria. The analytical results obtained for these locations from 2000 through 2012 are summarized in Appendix C. Laboratory reports presenting the 2012 results are provided in Appendix F.

### **15.2.1 Groundwater**

Groundwater samples were collected from wells 02-231, 02-232, and AS-1. The samples from all wells were analyzed for BTEX and PAHs. In addition, the sample from well 02-231 was also analyzed for DRO. TAH and TAqH were then calculated from the BTEX and PAH results. Figure 15-1 shows the locations of the wells and the analytical results of those data exceeding the endpoint criteria. Table 15-2 presents the analytical results.

DRO and BTEX compounds were not detected above the endpoint criteria in any groundwater sample collected in 2012. TAH exceeded the ADEC water quality standard (10 µg/L) in the 2012 samples collected from wells 02-231 and AS-1 at concentrations of 368 µg/L and 31 µg/L, respectively. In addition, TAqH exceeded the ADEC water quality standard (15 µg/L) in wells 02-231 and AS-1 at concentrations of 491 µg/L and 89 µg/L, respectively. The TAH and TAqH standards were not exceeded in the samples from well 02-232.

### **15.2.2 Surface Water**

The surface water samples, NSWSD-07 and NSWSD-08, were analyzed for DRO, BTEX, and PAHs. TAH and TAqH were calculated from the BTEX and PAH results. Figure 15-1 shows the locations where surface water samples were collected and the analytical results. Table 15-3 presents the analytical results.

None of the surface water samples showed concentrations of analytes above their respective ADEC water quality standards or risk-based cleanup levels (DRO, 250 µg/L; indeno(1,2,3-cd)pyrene, 0.28 µg/L; TAH, 10 µg/L; and TAqH, 15 µg/L).

### **15.2.3 Sediment**

The sediment samples (NSWSD-2, NSWSD-4, and NSWSD-5) were analyzed for DRO and PAHs. Figure 15-1 shows the locations where sediment samples were collected and the analytical results of those data in exceedance of the endpoint criteria. Table 15-4 presents the analytical results.

Endpoint Criteria <sup>3</sup>		250	0.28	10	15

*Notes:*

- <sup>1</sup> TAH results were calculated by summing the detected concentrations of BTEX when one or more were detected and by summing the reporting limits when none were detected.
- <sup>2</sup> TAqH results were calculated by summing the detections of BTEX and 16 PAHs when one or more were detected and by summing the reporting limits when none were detected.
- <sup>3</sup> The TAH and TAqH endpoint criteria are based on ADEC water quality standards as specified in 18 AAC 70.

**Bold** indicates reported concentration is greater than the endpoint criteria.

DRO was detected in sediment samples NSWSD-2, NSWSD-4, and NSWSD-5 at concentrations ranging from 100 mg/kg to 1,400 mg/kg, which exceed the risk-based cleanup level of 90.6 mg/kg. PAH compounds 2-methylnaphthalene and phenanthrene were not detected in any sediment samples above their respective risk-based cleanup levels of 0.0202 mg/kg and 0.225 mg/kg, respectively.

### 15.3 MONITORED NATURAL ATTENUATION

NAPs were collected at this site in 2009 to determine whether natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data indicated that biodegradation of petroleum hydrocarbons is likely occurring by iron (II) reduction; sulfate reduction; and methanogenesis as shown by elevated ferric iron concentrations, depleted sulfates, and elevated methane concentrations in comparison to background conditions. Groundwater parameters presented in Table 15-1 collected during the 2012 LTM event support evidence of continued natural attenuation as shown by the reducing environment (negative ORP) and depleted dissolved oxygen (0.0 mg/L) in the vicinity of the product recovery trench. A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

**Table 15-4.** Analytical Results for Sediment at South of Runway 18-36 Area

Location	Year	DRO (mg/kg)	2-Methylnaphthalene (mg/kg)	Phenanthrene (mg/kg)
NSWSD-2 Downgradient	2006	270 J	0.048 U	0.048 U

	2011	110 Y	0.0010 J	0.0046 U
	2012	430 Y	0.00068 J	0.0035 U
Endpoint Criteria		90.6	0.0202	0.225

*Notes:*

<sup>1</sup> Value is an elevated detection limit that is greater than the risk-based cleanup level due to matrix interference as reported by the laboratory.

**Bold** indicates reported concentration is greater than endpoint criteria.

## 15.4 TREND EVALUATION

Statistical evaluations were conducted on target analyte concentrations trends in accordance with the CMP, Revision 5 (Navy 2012e). Trend evaluations were conducted for only wells that had exceedances of endpoint criteria within the last two sampling events and have a minimum of four data points. Because groundwater in all wells has been below endpoint criteria for at least the last two consecutive years, trend evaluations were not performed at this site.

## 15.5 CONCLUSIONS

This section presents the conclusions based on a review of LTM activities performed at the South of Runway 18-36 Area site in 2012. The conclusions are as follows:

- Groundwater Flow: Based on historic and 2012 field measurements, the interpreted groundwater flow direction has a radial pattern that is generally to the north toward Crossover Canal and West Canal, to the west toward South Sweeper Creek, and to the southwest at the south end of the site toward Sweeper Cove.

- MNA: The groundwater parameters obtained during the 2012 LTM event provide evidence that natural attenuation of petroleum hydrocarbons continues to occur at the site.
- Free product was observed in wells E-216 and RW-18/36-04, at respective thickness of 0.43 feet and 0.06 feet. Groundwater sampling was not planned at this location.
- Well 02-231: This well is located within the contaminant plume. The DRO concentration was observed below the endpoint criteria in 2012 and has remained below the criteria for four consecutive sampling events. BTEX concentrations have remained below their respective endpoint criteria for eight sampling events. TAH and TAqH concentrations continue to exceed their respective endpoint criteria in 2012.
- Well 02-232: This well is located within the contaminant plume. BTEX, TAH, and TAqH concentrations have remained below their respective endpoint criteria for at least four sampling events. This well is located downgradient at the edge of the plume.
- Well AS-1: This well is located within the contaminant plume. BTEX concentrations have remained below their respective endpoints for six sampling events. For the 2012 samples, TAH and TAqH concentrations exceeded the ADEC water quality standards.
- Neither of the surface water samples, NSWSD-07 and NSWSD-08, exceeded endpoint criteria in 2012. All surface water samples collected have remained below endpoint criteria since sampling was initiated in 2006.
- Sediment Location NSWSD-2: DRO exceeded the endpoint criteria at 1,400 mg/kg. Oily sediments, sheen, and petroleum odor were observed when the sediment was disturbed during sampling. Phenanthrene and 2-methylnaphthalene were below endpoint criteria in this sample. This sample location is immediately downgradient and adjacent to the product recovery trench.
- Sediment Location NSWSD-4: DRO exceeded the endpoint criteria at 100 mg/kg. For the first time since sampling commenced at this location, no visible petroleum contamination was observed when the sediment was disturbed during sampling. DRO concentrations have decreased at this location compared to 2010 concentrations. Phenanthrene and 2-methylnaphthalene remained below endpoint criteria in sediment and have been below endpoint criteria for the past six sampling events. This sample location is downstream of the product recovery trench approximately 180 feet.

- Sediment Location NSWSD-5: DRO exceeded the endpoint criteria at 430 mg/kg. Oily sediments, sheen, and petroleum odor were observed when the sediment was disturbed during sampling. Phenanthrene and 2-methylnaphthalene remained below endpoint criteria in sediment and have been below endpoint criteria for the past six sampling events. This sample location is downstream of the product recovery trench approximately 300 feet.
- During a shoreline inspection of South Sweeper Creek at low tide downgradient from the site, black-stained sediment was observed at several sections of shoreline in the vicinity of sample locations NSWSD-4 and NSWSD-5, and just south of Moffett Road Bridge. Visible petroleum contamination was also observed during sediment sampling activities in South Sweeper Creek as described above.

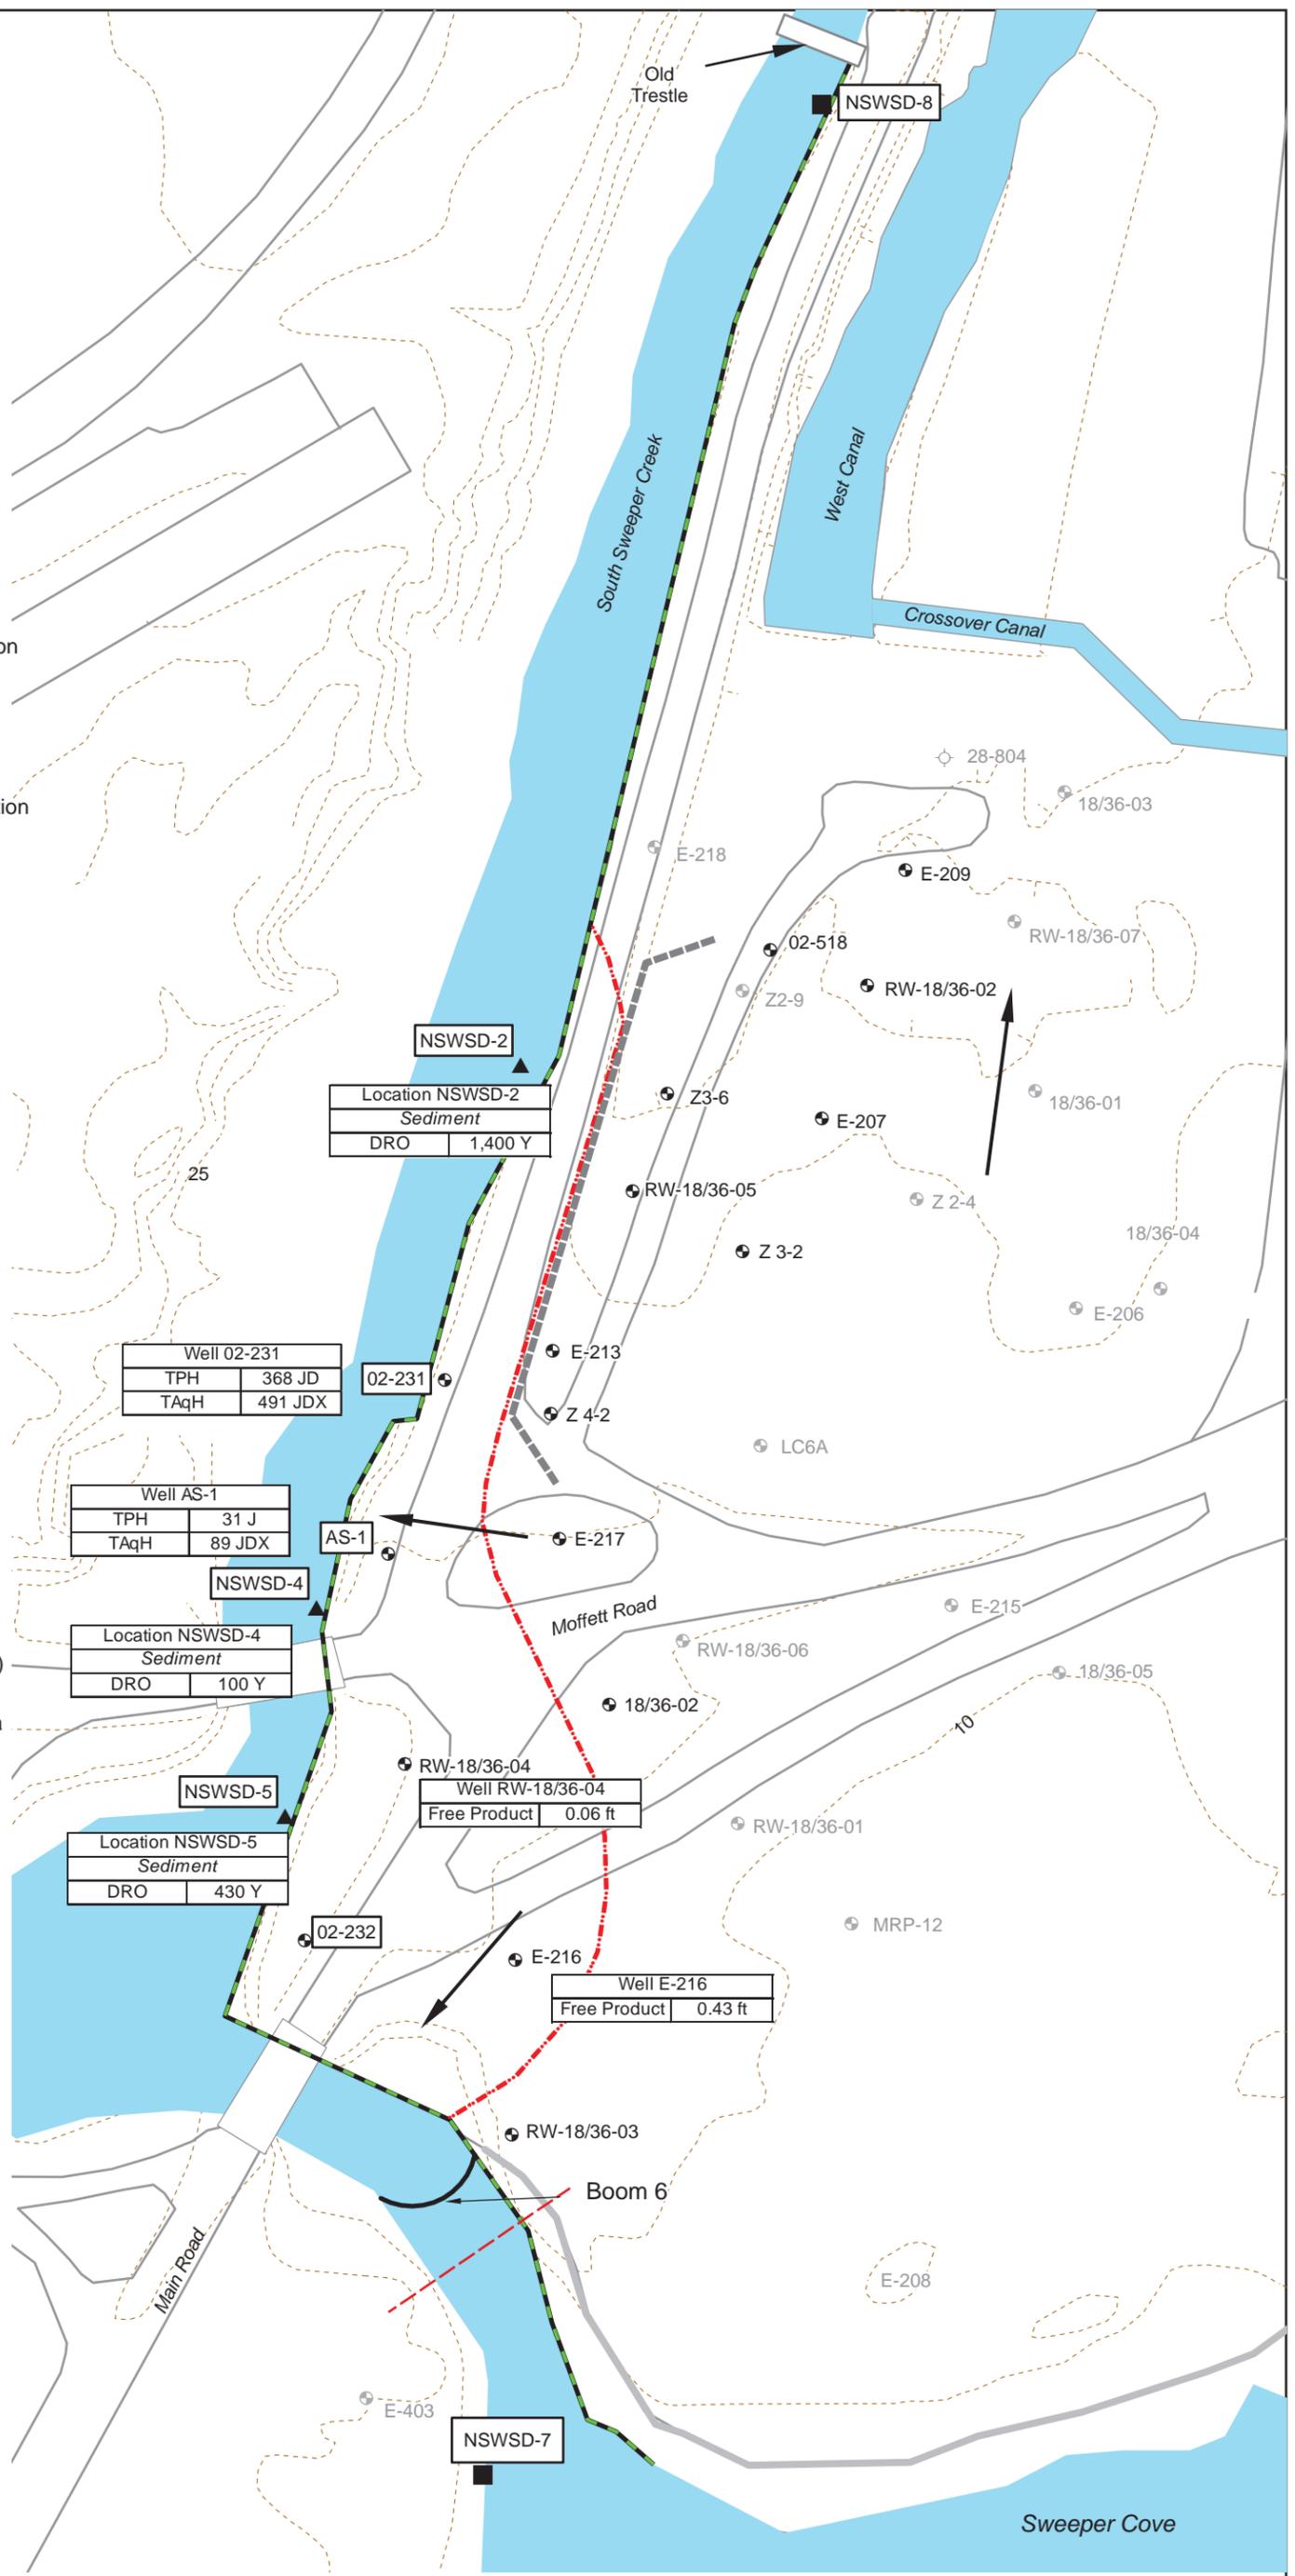

## 15.6 RECOMMENDATIONS

DRO continues to exceed endpoint criteria in shoreline sediments, and TAH and TAqH continue to exceed endpoint criteria in surface water protection wells. However, the observance of petroleum groundwater contamination (as free product or DRO concentrations) has greatly diminished across the site over the last two years. Therefore, it is recommended that all monitoring at the site, including groundwater, surface water, and sediment be reduced to every odd year with the next monitoring to occur in 2013. This recommendation is consistent with CMP, Revision 5 (Navy 2012e) to align all biennial sampling to odd year sampling.

It is further recommended that monitoring at the following five wells be discontinued because of the continued lack of observance of free product: 02-518, E-209, RW-18/36-02, E-207, and Z3-2.

## **16. SWMU 14, OLD PESTICIDE STORAGE AND DISPOSAL AREA**

This section presents the results of groundwater monitoring performed at SWMU 14, Old Pesticide Storage and Disposal Area site during 2012. The combination of MNA and compliance monitoring is the selected remedy for this site (Navy et al. 2000). To comply with requirements specified for this remedy, the Navy conducts periodic groundwater sampling and water level/product thickness monitoring at the site. Groundwater samples are collected to evaluate groundwater quality relative to endpoint criteria and to verify that natural attenuation is occurring.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, a discussion of natural attenuation conditions, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, trend evaluation analyses for historical target analyte concentration data, conclusions based on these analyses, and recommendations for future monitoring activities at the site.

### **16.1 FIELD MEASUREMENTS**

Depth-to-water and product thickness measurements were collected at four monitoring wells on August 30, 2012. Table 16-1 provides the measured depth to water and the calculated groundwater elevation. Figure 16-1 shows the location of the wells, the site topography and features, and the interpreted groundwater flow direction. The historic and current water level data indicate that the direction of groundwater flow beneath the site is to the south-southeast, toward Sweeper Cove. Free product was not observed in any well.

Groundwater sampling was also performed on August 30, 2012 at wells MW-14-5 and 01-153. Field measurements were recorded in the field forms and logbooks during monitoring well sampling activities (Appendix A). Table 16-1 lists the final field measurements recorded at the monitoring well prior to sample collection. A review of the field measurement data reported for well MW-14-5 indicates that groundwater parameters stabilized prior to sample collection. Parameters did not stabilize in well 01-153; therefore, three casing volumes were removed prior to sampling per CMP Revision 5 (Navy 2012e). The 2012 analytical results in this well are consistent with past analytical results and appear to be unaffected by the lack of stabilization.

**Table 16-1.** 2012 Field Measurements for SWMU 14, Old Pesticide Storage and Disposal Area

Well Location	Physical Measurements				Groundwater Parameters						
	Casing Elevation (ft MLLW)	Depth to Water (ft BTOC)	Groundwater Surface Elevation (ft MLLW)	Measured Product Thickness (ft)	pH (SU)	Specific Conductance (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Temperature (°C)	Salinity (%)	ORP (mV)

*Notes:*

The reported casing elevation is the surveyed elevation residing in the NIRIS database.

The last groundwater parameter measurement prior to sample collection is reported.

## 16.2 TARGET ANALYTE RESULTS

For the 2012 LTM event, the groundwater sample collected from well MW14-5 was analyzed for DRO, GRO, total lead, and dissolved lead. The groundwater sample collected from well 01-153 was analyzed for chlorinated VOCs and daughter products. Figure 16-1 shows the location of the well and the analytical results that are in exceedance of endpoint criteria. Tables 16-2 and 16-3 present the analytical results. The historical analytical results obtained for these locations are summarized in Appendix C. Laboratory reports presenting the 2012 results are provided in Appendix F.

DRO and GRO were detected above their endpoint criteria (1,500 µg/L and 1,300 µg/L, respectively) in well MW14-5 at concentrations of 3,100 µg/L and 7,000 µg/L, respectively. Additionally, total and dissolved lead were detected above endpoint criteria (15 µg/L) in this well at 17.2 µg/L and 17.0 µg/L, respectively. No chlorinated VOC or daughter products were detected above their respective endpoint criteria.

**Table 16-2.** Analytical Results for Petroleum-Related Chemicals and Metals for SWMU 14, Old Pesticide Storage and Disposal Area

Notes:

**Bold** indicates reported concentration is greater than the endpoint criteria.

## 16.3 MONITORED NATURAL ATTENUATION

NAPs were collected at this site in 2009 to determine whether natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data showed only weak evidence that petroleum biodegradation may be occurring at the site, possibly by aerobic digestion and iron reduction as shown by slightly elevated ferric iron concentrations and depleted dissolved oxygen levels. Groundwater parameters collected during the 2012 LTM event, which are presented in Table 16-1, suggest that continued natural attenuation

and dechlorination may be occurring as shown by the reducing environment (low [ $<50$ ] ORP) and depleted dissolved oxygen (0.0 mg/L) within the petroleum plume well at the site. A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

**Table 16-3.** Analytical Results for Volatile Organic Compounds for SWMU 14, Old Pesticide Storage and Disposal Area

Well Location	Year	PCE ( $\mu\text{g/L}$ )	TCE ( $\mu\text{g/L}$ )	1,1-DCE ( $\mu\text{g/L}$ )	Cis-1,2-DCE ( $\mu\text{g/L}$ )	Trans-1,2- DCE ( $\mu\text{g/L}$ )	Vinyl Chloride ( $\mu\text{g/L}$ )

Endpoint Criteria		5	5	7	70	100	2

Notes:

**Bold** indicates reported concentration is greater than the endpoint criteria for groundwater.

## 16.4 TREND EVALUATION

Statistical trend evaluations were conducted for target analyte concentrations in groundwater in accordance with the CMP, Revision 5 (Navy 2012e). Trend evaluation was conducted for only analytes that exceeded the endpoint criteria within the last two sampling events and had a minimum of four data points. The results of the Mann-Kendall trend evaluations are presented in Table 16-4. Worksheets and graphs are provided in Appendix H.

The following are the results of the statistical evaluation:

- Well MW14-5: DRO exhibits a stable concentration with no trend at the 80 and 95 percent confidence intervals. GRO and total lead are both decreasing at the 80 percent confidence interval and the Sen's evaluations indicate statistically significant decreasing trends with median slopes of -512 and -1.63, respectively. Dissolved lead exhibits a decreasing trend at both the 80 and 95 percent confidence intervals, and the Sen's evaluation has a statistically significant downward trend with a median slope of -1.50.

- Well 01-153: The PCE trend is decreasing at the 80 and 95 percent confidence intervals, and the Sen's evaluation also indicates a statistically significant downward trend with a median slope of -1.04.

## 16.5 CONCLUSIONS

This section presents conclusions based on a review of the groundwater monitoring conducted in 2012 at the SWMU 14, Old Pesticide Storage and Disposal Area site. The conclusions are as follows:

- Groundwater Flow: The groundwater flow direction is toward Sweeper Cove to the south-southeast.
- MNA: Groundwater parameters show evidence that petroleum biodegradation is occurring at the site, albeit weakly, possibly by aerobic digestion and iron reduction.
- Well MW14-5: This well is located within the contaminant plume. DRO, GRO, total lead, and dissolved lead were all detected above their endpoint criteria. DRO exhibits stable concentrations. GRO, total lead, and dissolved lead all exhibit statistically significant decreasing trends in concentrations.
- Well 01-153: No chlorinated VOC exceeded endpoint criteria. PCE has exceeded endpoint criteria in the past, but is exhibiting a statistically significant decreasing trend in concentration.

## 16.6 RECOMMENDATIONS

It is recommended that the biennial sampling at well 01-153 be changed to every odd year with the next sampling to occur in 2013 to be consistent with CMP, Revision 5 (Navy 2012e) to align all biennial sampling to odd year sampling.

DRO, GRO, total lead, and dissolved lead continue to exceed endpoint criteria at MW 14-5, but exhibit stable and statistically significant decreasing trends in concentrations. Therefore, it is recommended that monitoring for these parameters be reduced to every odd year with the next sampling to occur in 2013.

**Table 16-4.** Concentration Trend Evaluation for SWMU 14, Old Pesticide Storage and Disposal Area

Well	Target Analyte	Exceeds Endpoint Criteria	Highest Concentration Last Two Sampling Periods (µg/L)	Endpoint Criteria <sup>1</sup> (µg/L)	Sampling Periods (n)	Mann-Kendall Statistic (S)	Mann-Kendall Trend			Sen's Slope			
							Trend at 80% C.I.	Trend at 95% C.I.	Concentration Stability <sup>2</sup>	Median Slope	Statistically Significant Trend	2-Tailed Test at 80% C.I.	
											Lower Limit	Upper Limit	
MW14-5	DRO	Yes	5,100 Y	1,500	10	7	No trend	No trend	Stable	NC	NC	NC	NC
	GRO	Yes	11,000 DY	1,300	10	-20	Decreasing	No trend	NA	-512	Yes	-767	-220
	Total Lead	Yes	17.2	15	10	-19	Decreasing	No trend	NA	-1.63	Yes	-2.37	-0.95
	Dissolved Lead	Yes	17.0	15	10	-21	Decreasing	Decreasing	NA	-1.50	Yes	-2.36	-0.743
01-153	PCE	No	6.0	5	9	-22	Decreasing	Decreasing	NA	-1.04	Yes	-2.30	-0.548

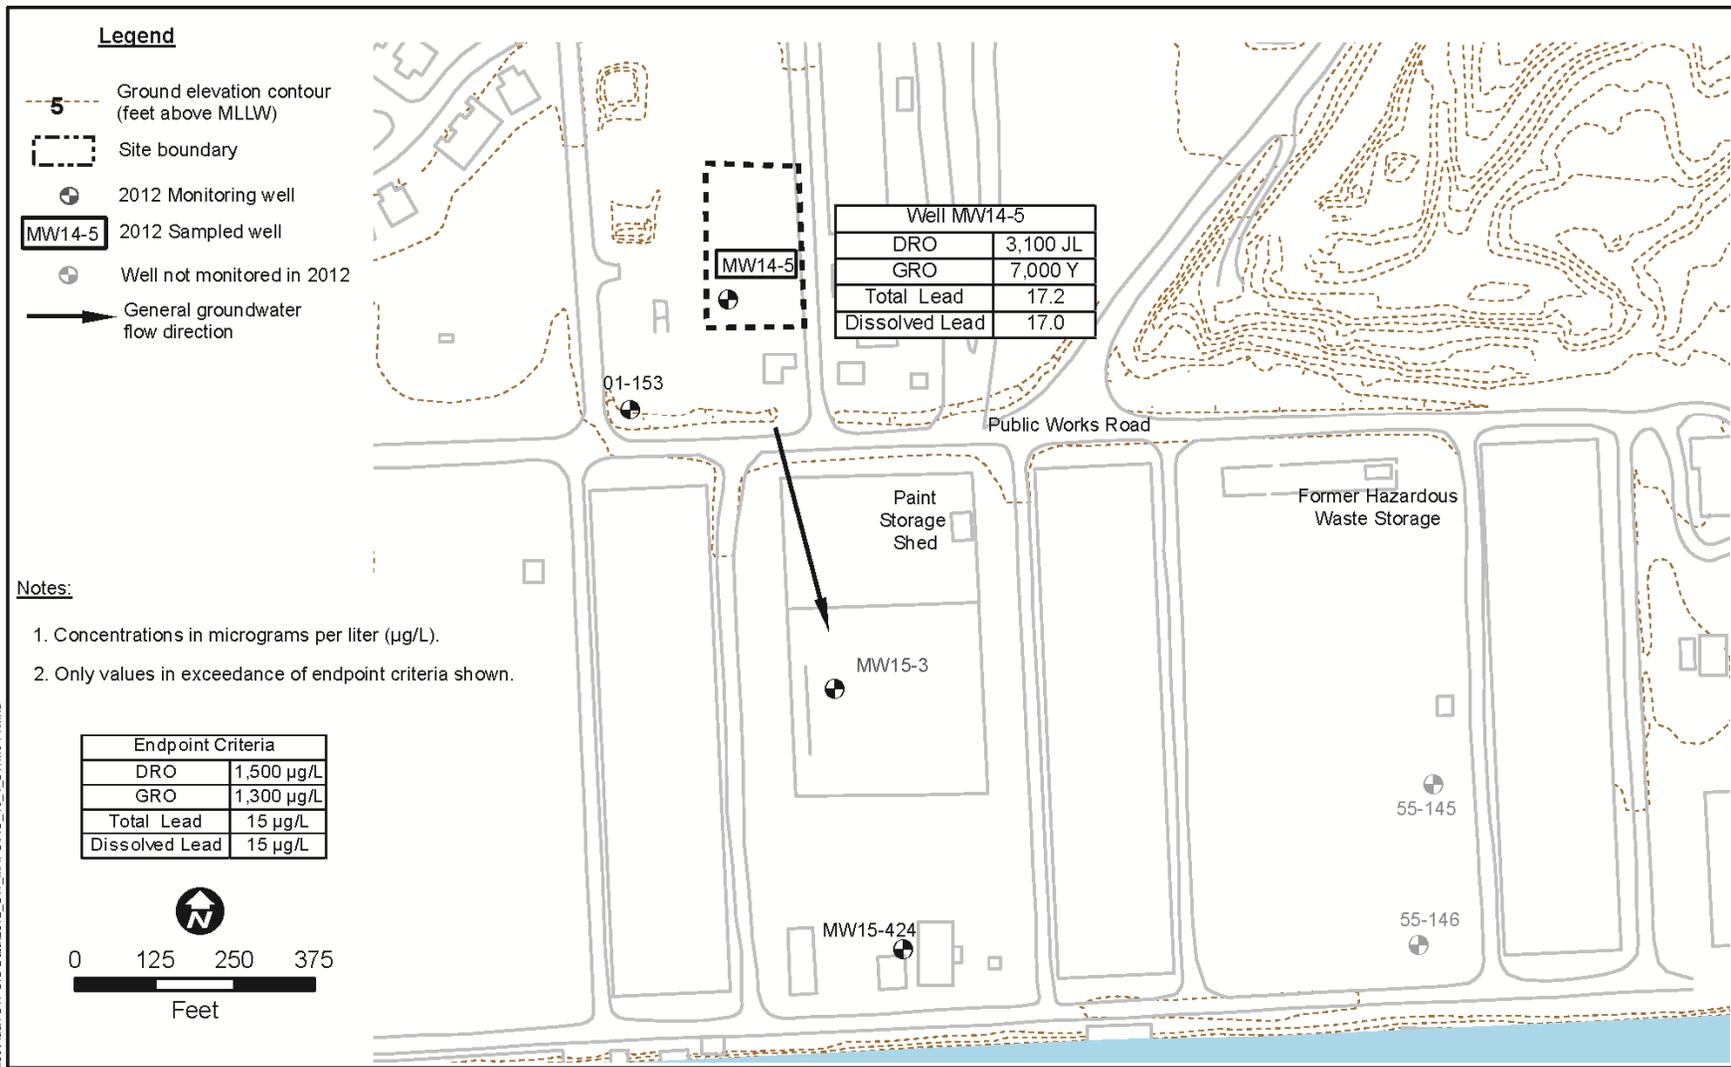

*Notes:*

<sup>1</sup> Endpoint criteria are established from ADEC cleanup levels for groundwater used as a drinking water source.

<sup>2</sup> Concentration stability is determined from the coefficient of variation when no trend exists at the 80% confidence interval (C.I.).

Sen's Slope is calculated for target analytes with decreasing concentration trends only.

 2012 Annual Groundwater  
 Monitoring Report

## **17. SWMU 17, POWER PLANT NO. 3 AREA**

This section presents the results of groundwater monitoring performed at the SWMU 17, Power Plant No. 3 Area site during 2012. The remedy specified for this site in the OU A ROD is free product recovery for petroleum and compliance monitoring for non-petroleum chemicals (Navy et al. 2000). MNA has been selected as the post-free product recovery remedy for this site. The program is implemented in part with the CMP, Revision 5 (Navy 2012e). Annual monitoring under the program in 2012 includes groundwater sampling and water level/product thickness monitoring. The groundwater at this site is not reasonably expected to be a potential future source of drinking water. Groundwater samples are collected from these wells to evaluate groundwater quality endpoints at 10 times the ADEC Table C values (18 AAC 75.345), to determine whether natural attenuation is occurring, to compare groundwater quality to endpoint criteria for compliance monitoring, and to monitor for surface water protection.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, a discussion of natural attenuation conditions, an interpretation of groundwater flow direction based on groundwater levels, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, trend evaluation analysis for historical target analyte concentration data, conclusions based on these analyses, and recommendations for future monitoring activities at the site.

### **17.1 FIELD MEASUREMENTS**

The site is located adjacent to the western edge of the Downtown Aquifer and is underlain by a thin layer of tephra overlying bedrock. Depth-to-water and product thickness measurements were collected at four monitoring wells on September 4, 2012. Table 17-1 provides the measured depth to water and the calculated groundwater elevation. No free product was observed in any site well.

Figure 17-1 shows the location of the wells, the site topography and features, and the interpreted groundwater flow direction. Historic and current water level data indicate that the direction of groundwater flow beneath the site conforms to the topographic slopes to the east-northeast, east, and southeast toward Yakutat Creek.

**Table 17-1.** 2012 Field Measurements for SWMU 17, Power Plant No. 3 Area

Physical Measurements					Groundwater Parameters						
Well Location	Casing Elevation (ft MLLW)	Depth to Water (ft BTOC)	Groundwater Surface Elevation (ft MLLW)	Measured Product Thickness (ft)	pH (SU)	Specific Conductance (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Temperature (°C)	Salinity (%)	ORP (mV)
05-735	19.00	15.98	3.02	0	6.61	0.525	19	0.00	7.05	0.0	-76
05-375	13.00	4.33	8.67	0	6.19	0.444	4	0.00	10.37	0.0	-45
PP-05	38.47	10.91	27.56	0	6.41	0.666	43	0.00	8.35	0.0	-56
R-1	13.43	2.24	11.19	0	6.47	0.482	3	1.48	7.62	0.0	-23

*Notes:*

The reported casing elevation is the surveyed elevation residing in the NIRIS database.  
 The last groundwater parameter measurement prior to sample collection is reported.

Field measurements were recorded in the field forms and logbooks during monitoring well sampling activities (Appendix A). Table 17-1 lists the final field measurements recorded at the monitoring well prior to sample collection. A review of the sampling data indicates that groundwater parameters stabilize to within specified criteria for all wells prior to sample collection.

## **17.2 TARGET ANALYTE RESULTS**

The groundwater samples from three monitoring wells, 05-375, PP-05, and R-1 were analyzed for DRO. The groundwater sample from monitoring well 05-735 was analyzed for select chlorinated VOCs (PCE, TCE, and daughter products). Figure 17-1 shows the location of the wells and the analytical results that are in exceedance of endpoint criteria. Tables 17-2 and 17-3 present the analytical results. Historical analytical results obtained for these locations are summarized in Appendix C. Laboratory reports presenting the 2012 results are provided in Appendix F.

DRO was not detected above the endpoint criteria of 15,000 µg /L at any of the wells sampled. Daughter products vinyl chloride and cis-1,2-DCE were detected at concentrations above their endpoint criteria (2 µg/L and 70 µg/L, respectively) in well 05-735 at 2.7 µg/L and 240 µg/L, respectively. No PCE, TCE, or any other daughter product was detected above endpoint criteria in this sample.

## **17.3 MONITORED NATURAL ATTENUATION**

NAPs were collected at this site in 2009 to determine whether natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data indicated that biodegradation of petroleum hydrocarbons is likely occurring by iron (II) reduction; sulfate reduction; and strong evidence of methanogenesis as shown by elevated ferric iron concentrations, depleted sulfates, and elevated methane concentrations in comparison to background conditions. Natural attenuation by dechlorination was also occurring as evidenced by the decreasing concentrations of PCE, TCE, and daughter products as well as the observed reducing environment. Groundwater parameters collected during the 2012 LTM event, which are presented in Table 17-1, provide evidence of continued natural attenuation and dechlorination as shown by the generally reducing environment (negative ORP), depleted dissolved oxygen (0.0 mg/L), and continued decreasing chlorinated compounds in well 05-735. A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

**Table 17-2.** Analytical Results for Petroleum-Related Chemicals for SWMU 17, Power Plant No. 3 Area

#### 17.4 TREND EVALUATION

Statistical trend evaluations were conducted for target analyte concentrations in groundwater in accordance with the CMP, Revision 5 (Navy 2012e). Trend evaluation was conducted for only analytes that exceeded the endpoint criteria within the last two sampling events and had a minimum of four data points. Results of the Mann-Kendall and Sen's trend evaluations are summarized in Table 17-4. Worksheets and graphs are provided in Appendix H.

**Table 17-3.** Analytical Results for Volatile Organic Compounds for SWMU 17, Power Plant No. 3 Area

Well Location	Year	PCE (µg/L)	TCE (µg/L)	1,1-DCE (µg/L)	cis-1,2-DCE (µg/L)	trans-1,2-DCE (µg/L)	Vinyl Chloride (µg/L)

	2010	1.3	2.3	0.96	<b>400 D</b>	18	<b>4.3</b>
	2011	1.6	2.6	0.68	<b>280 DJ</b>	13	<b>2.8</b>
	2012	0.90	1.6	0.75	<b>240 D</b>	13	<b>2.7</b>
Endpoint Criteria		5	5	7	70	100	2

Note:

**Bold** indicates reported concentration is greater than the endpoint criteria.

The following are the results of the statistical evaluation:

- Well 05-735: cis-1,2-DCE exhibits a decreasing trend at the 80 and 95 percent confidence intervals, with a statistically significant Sen's evaluation of a decreasing trend with a median slope of -27.3. Vinyl chloride exhibits a decreasing trend at the 80 and 95 percent confidence intervals, with a statistically significant Sen's evaluation of a decreasing trend with a median slope of -0.278.

## 17.5 CONCLUSIONS

This section presents the conclusions based on a review of groundwater monitoring conducted at the SWMU 17, Power Plant No. 3 Area site in 2012. The conclusions are as follows:

- Groundwater Flow: Based on historic and current field measurements and site topography, the interpreted groundwater flow direction is toward Yakutat Creek, which flows around the site on the northeast, east, southeast, and south.
- MNA: The groundwater parameters obtained during the 2012 LTM event provided evidence that natural attenuation by dechlorination was occurring as evidenced by the decreasing concentrations of PCE and daughter products. The groundwater parameters support evidence of continued natural attenuation as shown by the generally reducing environment (negative ORP) and depleted dissolved oxygen (0.0 mg/L).

- Well 05-735: Vinyl chloride and cis-1,2-DCE were detected in groundwater collected at concentrations above endpoint criteria. These are breakdown products of PCE and TCE, which have been detected below the endpoint criteria for four consecutive sampling events. Vinyl chloride and cis-1,2-DCE exhibit decreasing trends that are significant based on statistical analysis.
- Wells 05-375, PP-05, and R-1: DRO remained below endpoint criteria in all these wells for at least three consecutive sampling events.

## **17.6 RECOMMENDATIONS**

Because concentrations of DRO have remained below endpoint criteria in wells 05-375, PP-05, and R-1 for at least three consecutive sampling events and because free product is no longer observed in these wells, it is recommended that monitoring at these locations be discontinued.

Vinyl chloride and cis-1,2-DCE remain above endpoint criteria in compliance well 05-375 but are exhibiting statistically significant decreasing concentrations. Therefore, it is recommended that monitoring at this location be reduced to every odd year with the next sampling occurring in 2013. This is consistent with the CMP, Revision 5 (Navy 2012e) to align all biennial sampling to odd year sampling.

**Table 17-4.** Concentration Trend Evaluation for SWMU 17, Power Plant No. 3 Area

Well	Target Analyte	Exceeds Endpoint Criteria	Highest Concentration Last Two Sampling Periods (µg/L)	Endpoint Criteria <sup>1</sup> (µg/L)	Sampling Periods (n)	Mann-Kendall Statistic (S)	Mann-Kendall Trend			Sen's Slope			
							Trend at 80% C.I.	Trend at 95% C.I.	Concentration Stability <sup>2</sup>	Median Slope	Statistically Significant Trend	2-Tailed Test at 80% C.I.	
											Lower Limit	Upper Limit	
05-735	cis-1,2-DCE	Yes	280 DJ	70	10	-32	Decreasing	Decreasing	NA	-27.3	Yes	-35.8	-2.50
	Vinyl Chloride	Yes	2.8	2	10	-29	Decreasing	Decreasing	NA	-0.278	Yes	-0.50	-0.13

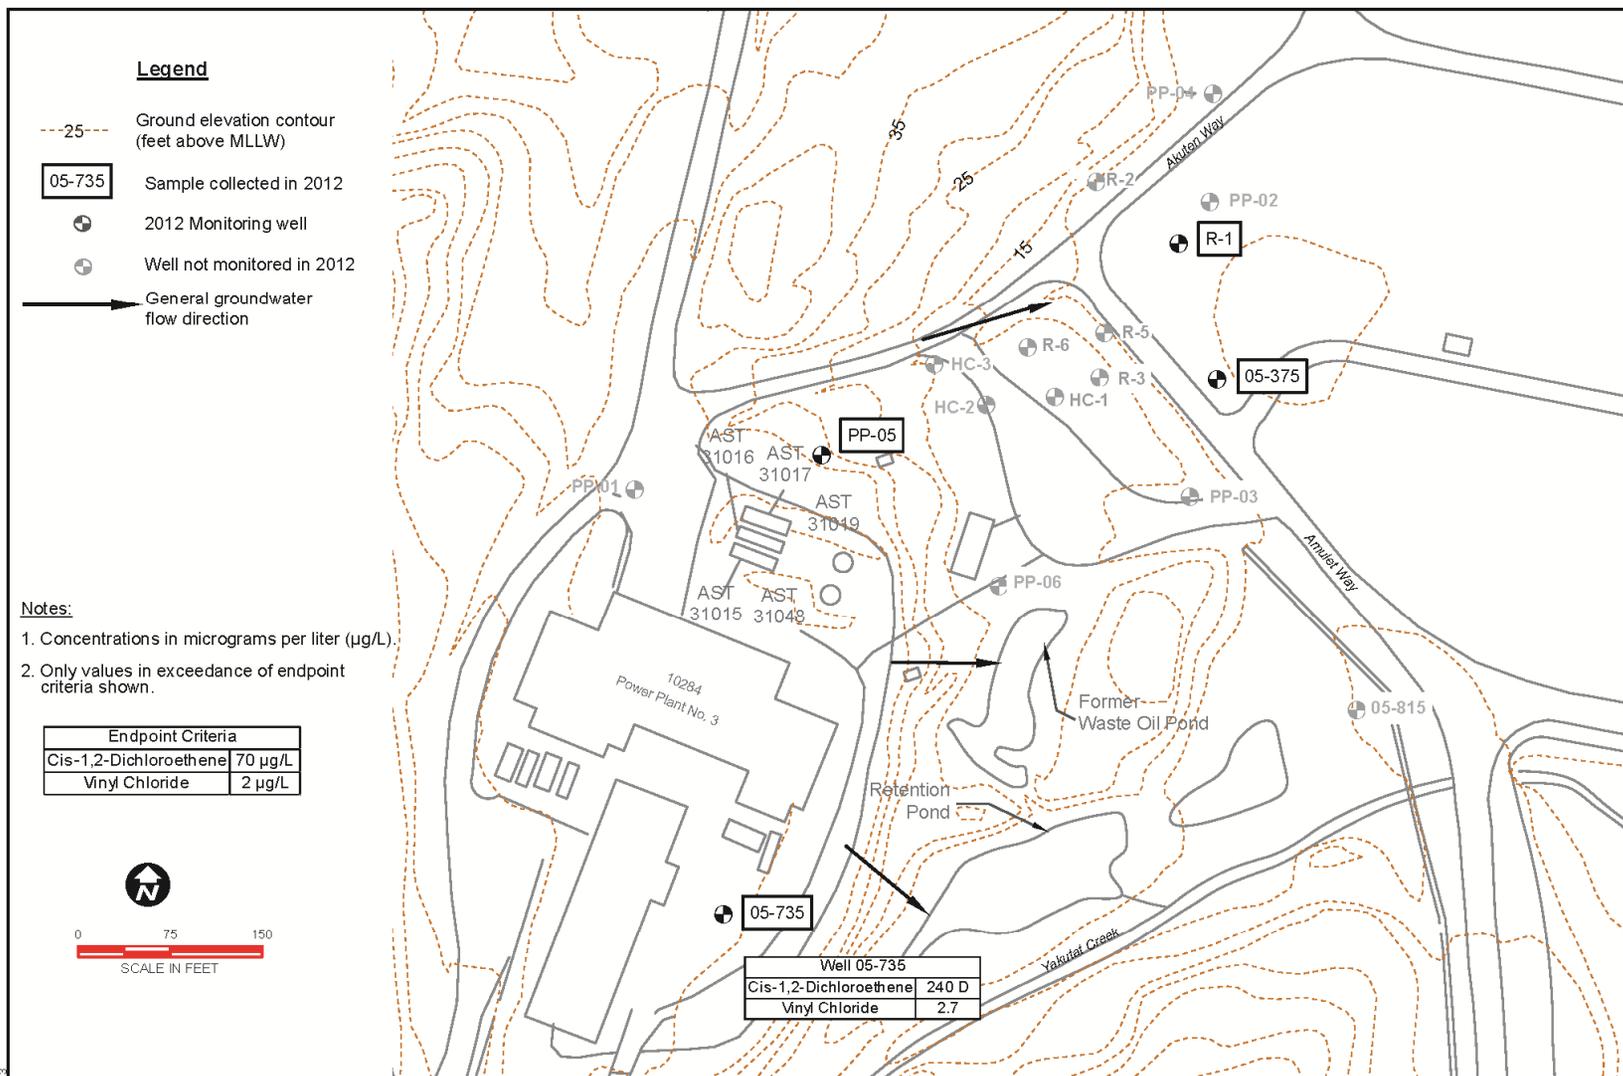

*Notes:*

<sup>1</sup>Endpoint criteria are established from ADEC cleanup levels for groundwater used as a drinking water source.

<sup>2</sup>Concentration stability is determined from the coefficient of variation when no trend exists at the 80% confidence interval (C.I.).

Sen's Slope is calculated for target analytes with decreasing concentration trends only.

 Monitoring Report

## **18. SWMU 58/SA 73, HEATING PLANT 6**

This section presents the results of groundwater monitoring performed at the SWMU 58/SA 73, Heating Plant 6 site during 2012. The remedy specified for this site in the OU A ROD is free product recovery (Navy et al. 2000). The Navy and ADEC have selected MNA with ICs as the post-free product recovery remedy for this site (Navy and ADEC 2005). To comply with requirements specified for this remedy, the Navy initiated annual groundwater sampling and water level/product thickness monitoring. The groundwater at this site is not reasonably expected to be a potential future source of drinking water. Groundwater samples are collected from these wells to evaluate groundwater quality for endpoint criteria established at 10 times the ADEC Table C values (18 AAC 75.345), to determine whether natural attenuation is occurring, and to monitor for surface water protection.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, a discussion of natural attenuation conditions, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, trend evaluation analyses for historical target analyte concentration data, conclusions based on these analyses, and recommendations for future monitoring activities at the site.

### **18.1 FIELD MEASUREMENTS**

Depth-to-water and product thickness measurements were collected at 11 monitoring wells on August 29, 2012. Table 18-1 provides the measured depths to water, the calculated groundwater elevations, and the product thicknesses, if present. Groundwater elevations were corrected for the presence of free product (Appendix D). Figure 18-1 shows the locations of the wells, the site topography and features, and the interpreted groundwater flow direction.

The site is underlain by a relatively thin layer of tephra and glacial till overlying bedrock. The aquifer is characterized as intermittent within the more permeable zones of the overlying surficial material (Navy 2004). The water level data indicate that the direction of groundwater flow in this aquifer is to the southeast, toward Clam Lagoon.

Three monitoring wells were sampled on August 31, 2012 (Figure 18-1). Sampling was planned at well 12-121 but 0.03 feet of free product was observed here; therefore, sampling was not conducted as prescribed by the CMP. Field measurements were recorded in the field forms and logbooks during monitoring well sampling activities (Appendix A).

**Table 18-1.** 2012 Field Measurements for SWMU 58/SA 73, Heating Plant 6

Physical Measurements					Water Quality Parameters

12-611	58.11	4.08	54.03	0	NP	NP	NP	NP	NP	NP	NP

*Notes:*

<sup>1</sup> Corrected for presence of free product in the well.  
 The reported casing elevation is the surveyed elevation residing in the NIRIS database.  
 The last groundwater parameter measurement prior to sample collection is reported.

Table 18-1 lists the final field measurements recorded at each monitoring well prior to sample collection. A review of the sampling data reported for this site indicated that prior to sample collection, all groundwater parameters stabilized in wells 12-105 and 12-203. However, groundwater parameters did not stabilize in well 12-114 and the required three casing volumes of groundwater were removed prior to sampling per CMP Revision 5 (Navy 2012e). The 2012 analytical results in this well are consistent with past analytical results and appear to be unaffected by the lack of stabilization.

Monthly free product recovery activities were performed at this site during contract year 2011/2012 (October through September). No free product was recovered from the site during this time period. Monthly free product recovery activities are summarized in Appendix J.

A shoreline inspection was performed along the stream from the top of the ravine to downgradient of well 12-604. No flowing water was observed in the perennial stream. No evidence of petroleum contamination was observed during the shoreline inspection. Surface water/sediment sampling was to be performed at this location if contamination was observed during the inspection. Since no contamination was observed, surface water/sediment sampling was not performed. Shoreline inspection results are summarized in Section 4.1.3.

## **18.2 TARGET ANALYTE RESULTS**

The groundwater samples collected from wells 12-105, 12-114, and 12-203 were analyzed for DRO. Table 18-2 presents the analytical results. Figure 18-1 shows the location of the wells and the analytical results that exceeded the endpoint criteria. The historical analytical results obtained for these locations are summarized in Appendix C. Laboratory reports presenting the 2012 results are provided in Appendix F.

DRO concentrations for all wells were below the endpoint criteria (15,000 µg/L) in 2012.

## **18.3 MONITORED NATURAL ATTENUATION**

NAPs were collected at this site in 2009 to determine whether natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data indicated that biodegradation of petroleum hydrocarbons is likely occurring by iron (II) reduction; sulfate reduction; and methanogenesis as shown by elevated ferric iron concentrations, depleted sulfates, and elevated methane concentrations in comparison to background conditions. Groundwater parameters presented collected during the 2012 LTM event, which are presented in Table 18-1, support evidence of continued natural attenuation as shown by the reducing environment (negative ORP) and depleted dissolved oxygen (0.0 mg/L) within the plume. A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

**Table 18-2.** Analytical Results for Petroleum-Related Chemicals for SWMU 58/SA 73, Heating Plant 6

	Endpoint Criteria <sup>1</sup>	

Notes:

<sup>1</sup> The endpoint criteria are 10 times the ADEC cleanup levels for groundwater as a drinking water source and as specified in 18 AAC 75.345[b][1], Table C.

**Bold** indicates reported concentration is greater than the endpoint criteria.

#### 18.4 TREND EVALUATION

Statistical trend evaluations were conducted for target analyte concentrations in groundwater in accordance with the CMP, Revision 5 (Navy 2012e). Trend evaluation is conducted for only analytes that exceeded the endpoint criteria within the last two sampling events and had a minimum of four data points. Because the target analytes did not meet these requirements, no evaluation was performed for this site.

## 18.5 CONCLUSIONS

This section presents conclusions based on groundwater monitoring conducted at SWMU 58/SA 73, Heating Plant 6 site in 2012. The conclusions are as follows:

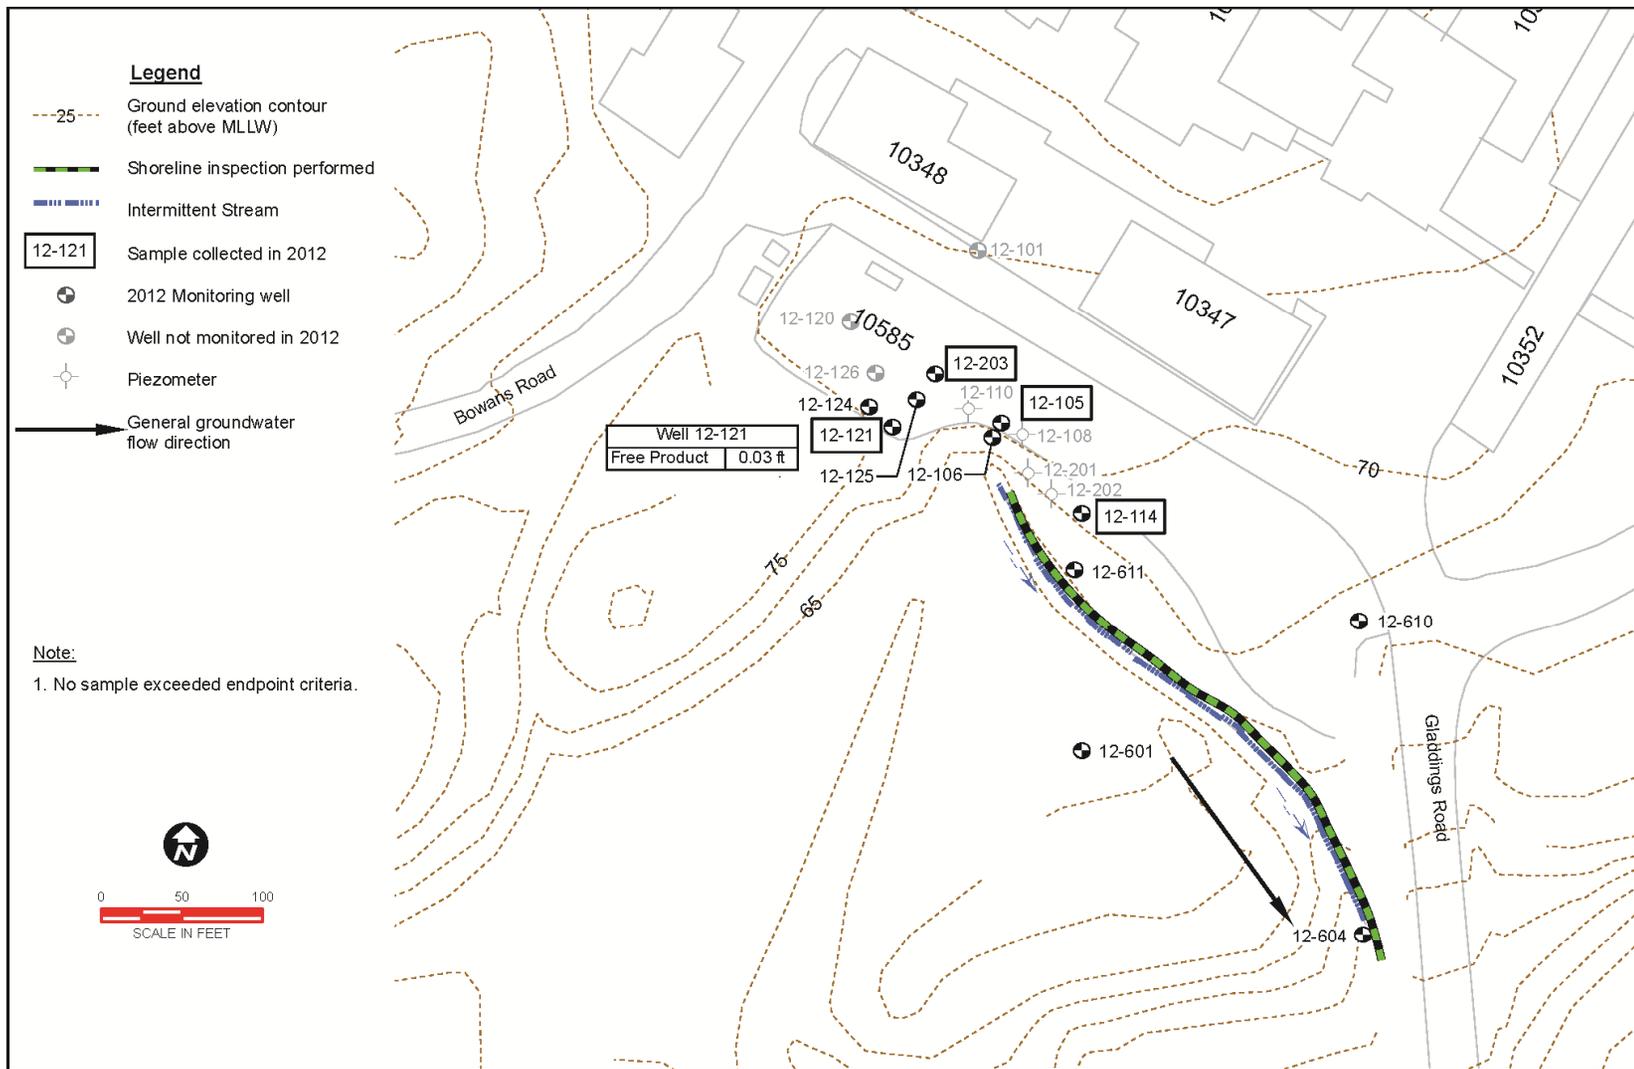

- Groundwater Flow: Based on the field measurements in August 2012, the groundwater flow direction is to the southeast toward Clam Lagoon.
- MNA: The groundwater parameter data obtained during the 2012 LTM event provides evidence that natural attenuation of petroleum hydrocarbons continues to occur at the site.
- Free product was present in well 12-121 at a thickness of 0.03 feet. No free product was recovered from the site during monthly activities from October 2011 through September 2012 (Appendix J).
- Well 12-105: DRO was detected below the endpoint criteria at this downgradient plume edge well since 2010 (three consecutive sampling events).
- Well 12-114: DRO has been detected below the endpoint criteria at this downgradient plume edge well since sampling began in 2002 (six consecutive sampling events).
- Well 12-121: Free product was detected at 0.03 feet which prevented sampling of groundwater. Free product has been observed twice in this well since 2009 at a minimal thickness of 0.01 feet. DRO has not exceeded endpoint criteria in this well since 2007 (three consecutive sampling events).
- Well 12-203: DRO has remained at or below endpoint criteria in this well since 2010 (two consecutive sampling events).
- A shoreline inspection of the intermittent stream flowing through the site revealed no evidence of petroleum contamination. The stream bed is thickly vegetated and marshy.

## 18.6 RECOMMENDATIONS

It is recommended that monitoring at this site be discontinued and the site be recommended for closure based on the following reasons:

- DRO concentrations have remained below endpoint criteria for at least two consecutive sampling events;

- The observance of free product across the site has greatly reduced and was observed in only one well at a thickness of 0.03 feet;
- No free product was recovered from the site from October 2011 to September 2012;  
and
- There was no evidence of petroleum contamination in the intermittent stream that flows through the site.

## **19. SWMU 60, TANK FARM A**

This section presents the results of groundwater monitoring performed at the SWMU 60, Tank Farm A site during 2012. MNA is the remedy selected for this site (Navy et al. 2000). To comply with requirements specified for this remedy, the Navy has conducted periodic groundwater sampling and water level/product thickness monitoring at the site. Groundwater samples have been collected to evaluate groundwater quality relative to Alaska groundwater cleanup levels (18 AAC 75.345), to verify that natural attenuation is occurring, and to monitor for surface water protection.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, a discussion of natural attenuation conditions, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, trend evaluation analyses for historical target analyte concentration data, conclusions based on these analyses, and recommendations for future monitoring activities at the site.

### **19.1 FIELD MEASUREMENTS**

Depth-to-water and product thickness measurements were collected at six monitoring wells on September 5, 2012. Table 19-1 provides the measured depths to water (corrected for product thickness, if present) and the calculated groundwater elevations. One well, 653, had measurable free product at 0.01 feet in thickness. Figure 19-1 shows the locations of the wells relative to surface features, analytical results that exceeded endpoint criteria, and site topography.

The site is divided into two areas of upper and lower elevations. The upper elevation part of the site is underlain by a relatively thin layer of tephra and glacial till overlying bedrock. The lower elevation part is underlain by a thin strip of sandy aquifer bounded between the hillside to the west and South Sweeper Creek/Sweeper Cove to the east. The analysis of limited water level data and the hydrogeologic setting of the site indicate that the groundwater flow direction in the upland area follows site topography and flows southeast toward South Sweeper Creek in the lowland area.

**Table 19-1.** 2012 Field Measurements for SWMU 60, Tank Farm A

Notes:

<sup>1</sup> Corrected for presence of free product in the well.

The reported casing elevation is the surveyed elevation residing in the NIRIS database.

The last groundwater parameter measurement prior to sample collection is reported.

Four monitoring wells were sampled on September 5, 2012. Surface water and sediment samples were collected on August 28, 2012 at location 852 during minus low tide. Because of the very low tide conditions, the nearest surface water to the sediment sample location available for sampling was approximately 75 feet away and to the east (Photographs 111 and 112, Appendix I). Field measurements were recorded on field data forms and logbooks during monitoring well sampling activities (Appendix A). Table 19-1 lists the final field measurements recorded at each water sampling location prior to sample collection. A review of the sampling data reported for the site indicates that three wells (LC5A, 653, and MW-E006) stabilized prior to sample collection. The remaining three wells did not stabilize, which required three casing volumes of groundwater be removed from each well prior to sampling per CMP Revision 5 (Navy 2012e). The 2012 analytical results in these wells are consistent with past analytical results and appear to be unaffected by the lack of stabilization.

A visual inspection of the southwestern shoreline of South Sweeper Creek downgradient of LC5A was performed in 2012. During the inspection, a petroleum seep, oily sediments, heavy petroleum odor, iron staining, and sheen/discoloration were observed on the west side of Sweeper Creek lagoon adjacent to the west culvert (Figure 19-1). A surface water/sediment sample was collected at the seep at location 852 and analyzed for petroleum hydrocarbons to determine if natural recovery is progressing. DRO concentrations in surface water at this location fell below endpoint criteria for the first time since 2008. However, DRO concentrations in sediment rose from 1,400 mg/kg in 2011 to 10,000 mg/kg in 2012 (described in more detail below). Petroleum sheen and odor were observed when sediments were disturbed during the sample collection at location 852. Due to the minus tide, the surface water sample was collected approximately 75 feet from the seep where the sediment portion was collected. Results of visual inspections are summarized in Section 4.1.3.

A boom is being maintained at this seep on a monthly basis to control the migration of sheen into downstream waters, namely Sweeper Cove. Additionally, periodic free product recovery was performed at wells 652 and 653 during October 2011 through September 2012. A total of 0.20 gallons was recovered from site wells during this time period. The monthly free product recovery activities are summarized in Appendix J. A summary of boom maintenance for this site is presented in the Remedial Action Summary Report for Adak, Alaska (Navy 2013).

## **19.2 TARGET ANALYTE RESULTS**

The groundwater samples collected from monitoring wells 650, 651, 652, and 653, and surface water sample 852 were analyzed for DRO, BTEX, and PAHs. BTEX and PAHs were

used to calculate TAH and TAqH for the samples. The groundwater sample collected from well LC5A was analyzed for BTEX and PAHs which were used to calculate TAH and TAqH. The groundwater sample collected from well MW-E006 was analyzed for benzene. Sediment sample 852 was analyzed for DRO and PAHs. Tables 19-2, 19-3, and 19-4 present the groundwater, surface water, and sediment analytical results, respectively. Historical analytical results obtained for these locations are summarized in Appendix C. Laboratory reports presenting the 2012 results are provided in Appendix F.

DRO concentrations for the lowland wells 650 (1,600 µg/L), 652 (4,000 µg/L), and 653 (1,900 µg/L) all exceeded the endpoint criteria of 1,500 µg/L. The remaining lowland well sampled for DRO in 2012 (651) was below the endpoint criteria of 1,500 µg/L. All BTEX constituents were detected below their respective endpoint criteria in wells 650, 651, 652, 653, and LC5A except for benzene which was detected above the endpoint criteria in well 650 at a concentration of 10 µg/L. TAH and TAqH concentrations exceeded the respective water quality standards of 10 µg/L and 15 µg/L in all lowland wells, 650, 651, 652, 653, and LC5A. TAH concentrations ranged from 7.4 µg/L to 93 µg/L and TAqH concentrations ranged from 10.3 µg/L to 127 µg/L in these wells.

Benzene was detected at a concentration criteria in upland well MW-E006 which did not exceed the endpoint criteria of 5.0 µg/L.

DRO (130 µg/L) was detected below the risk-based cleanup level of 250 µg/L in the surface water sample collected at the 852 sample location. The concentrations of TAH, TAqH, and indeno(1,2,3-cd)pyrene were also detected in this sample below endpoint criteria.

DRO was detected in sediment sample 852 at 10,000 mg/kg, which exceeded the endpoint criteria of 90.6 mg/kg. Phenanthrene was not detected in sample 852 but the method detection limit of 0.470 mg/kg was elevated above the endpoint criteria of 0.225 mg/kg due to matrix interferences. 2-methylnaphthalene was detected in this sample below the endpoint criteria of 0.0202 mg/kg.

### **19.3 MONITORED NATURAL ATTENUATION**

NAPs were collected at this site in 2009 to determine whether natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data indicated that biodegradation of petroleum hydrocarbons is occurring by iron (II) reduction; sulfate reduction; and strong evidence of methanogenesis as shown by elevated ferric iron concentrations, depleted sulfates, and elevated methane concentrations in comparison to background conditions. Groundwater parameters presented in Table 19-1 collected during

the 2012 LTM event supports evidence of continued natural attenuation as shown by the reducing environment (negative ORP) and depleted dissolved oxygen (0.0 mg/L) at the site. A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

Notes:

- <sup>1</sup> Reporting limit is elevated due to matrix interference. (The method detection limit is elevated to the same value due to the interference.)

**Bold** indicates reported concentration is greater than the endpoint criteria.

## 19.4 TREND EVALUATION

Statistical trend evaluations were conducted for target analyte concentrations in groundwater in accordance with the CMP, Revision 5 (Navy 2012e). Trend evaluation was conducted for only analytes that exceeded the endpoint criteria within the last two sampling events and had a minimum of four data points. Results of the Mann-Kendall and Sen's trend evaluations are summarized in Table 19-5. Worksheets and graphs are provided in Appendix H.

**Table 19-5.** Concentration Trend Evaluation for SWMU 60, Tank Farm A

Well	Target Analyte	Exceeds Endpoint Criteria	Highest Concentration Last Two Sampling Periods (µg/L)	Endpoint Criteria <sup>1</sup> (µg/L)	Sampling Periods (n)	Mann-Kendall Statistic (S)	Mann-Kendall Trend			Sen's Slope			
							Trend at 80% C.I.	Trend at 95% C.I.	Concentration Stability <sup>2</sup>	Median Slope	Statistically Significant Trend	2-Tailed Test at 80% C.I.	
												Lower Limit	Upper Limit
MW-E006	Benzene	No	7.4	5	10	-23	Decreasing	Decreasing	NA	-1.45	Yes	-1.72	-0.40

*Notes:*

<sup>1</sup> Endpoint criteria are established from ADEC cleanup levels for groundwater used as a drinking water source.

<sup>2</sup> Concentration stability is determined from the coefficient of variation when no trend exists at the 80% confidence interval (C.I.).

Sen's Slope is calculated for target analytes with decreasing concentration trends only.

The following is the result of the statistical evaluation:

- Well MW-E006: Benzene exhibits a decreasing trend at the 80 and 95 percent confidence intervals, with a Sen's evaluation that indicates a statistically significant downward trend with a median slope of -1.45

## 19.5 CONCLUSIONS

This section presents the conclusions based on a review of groundwater monitoring conducted at the SWMU 60, Tank Farm A site in 2012. The conclusions are as follows:

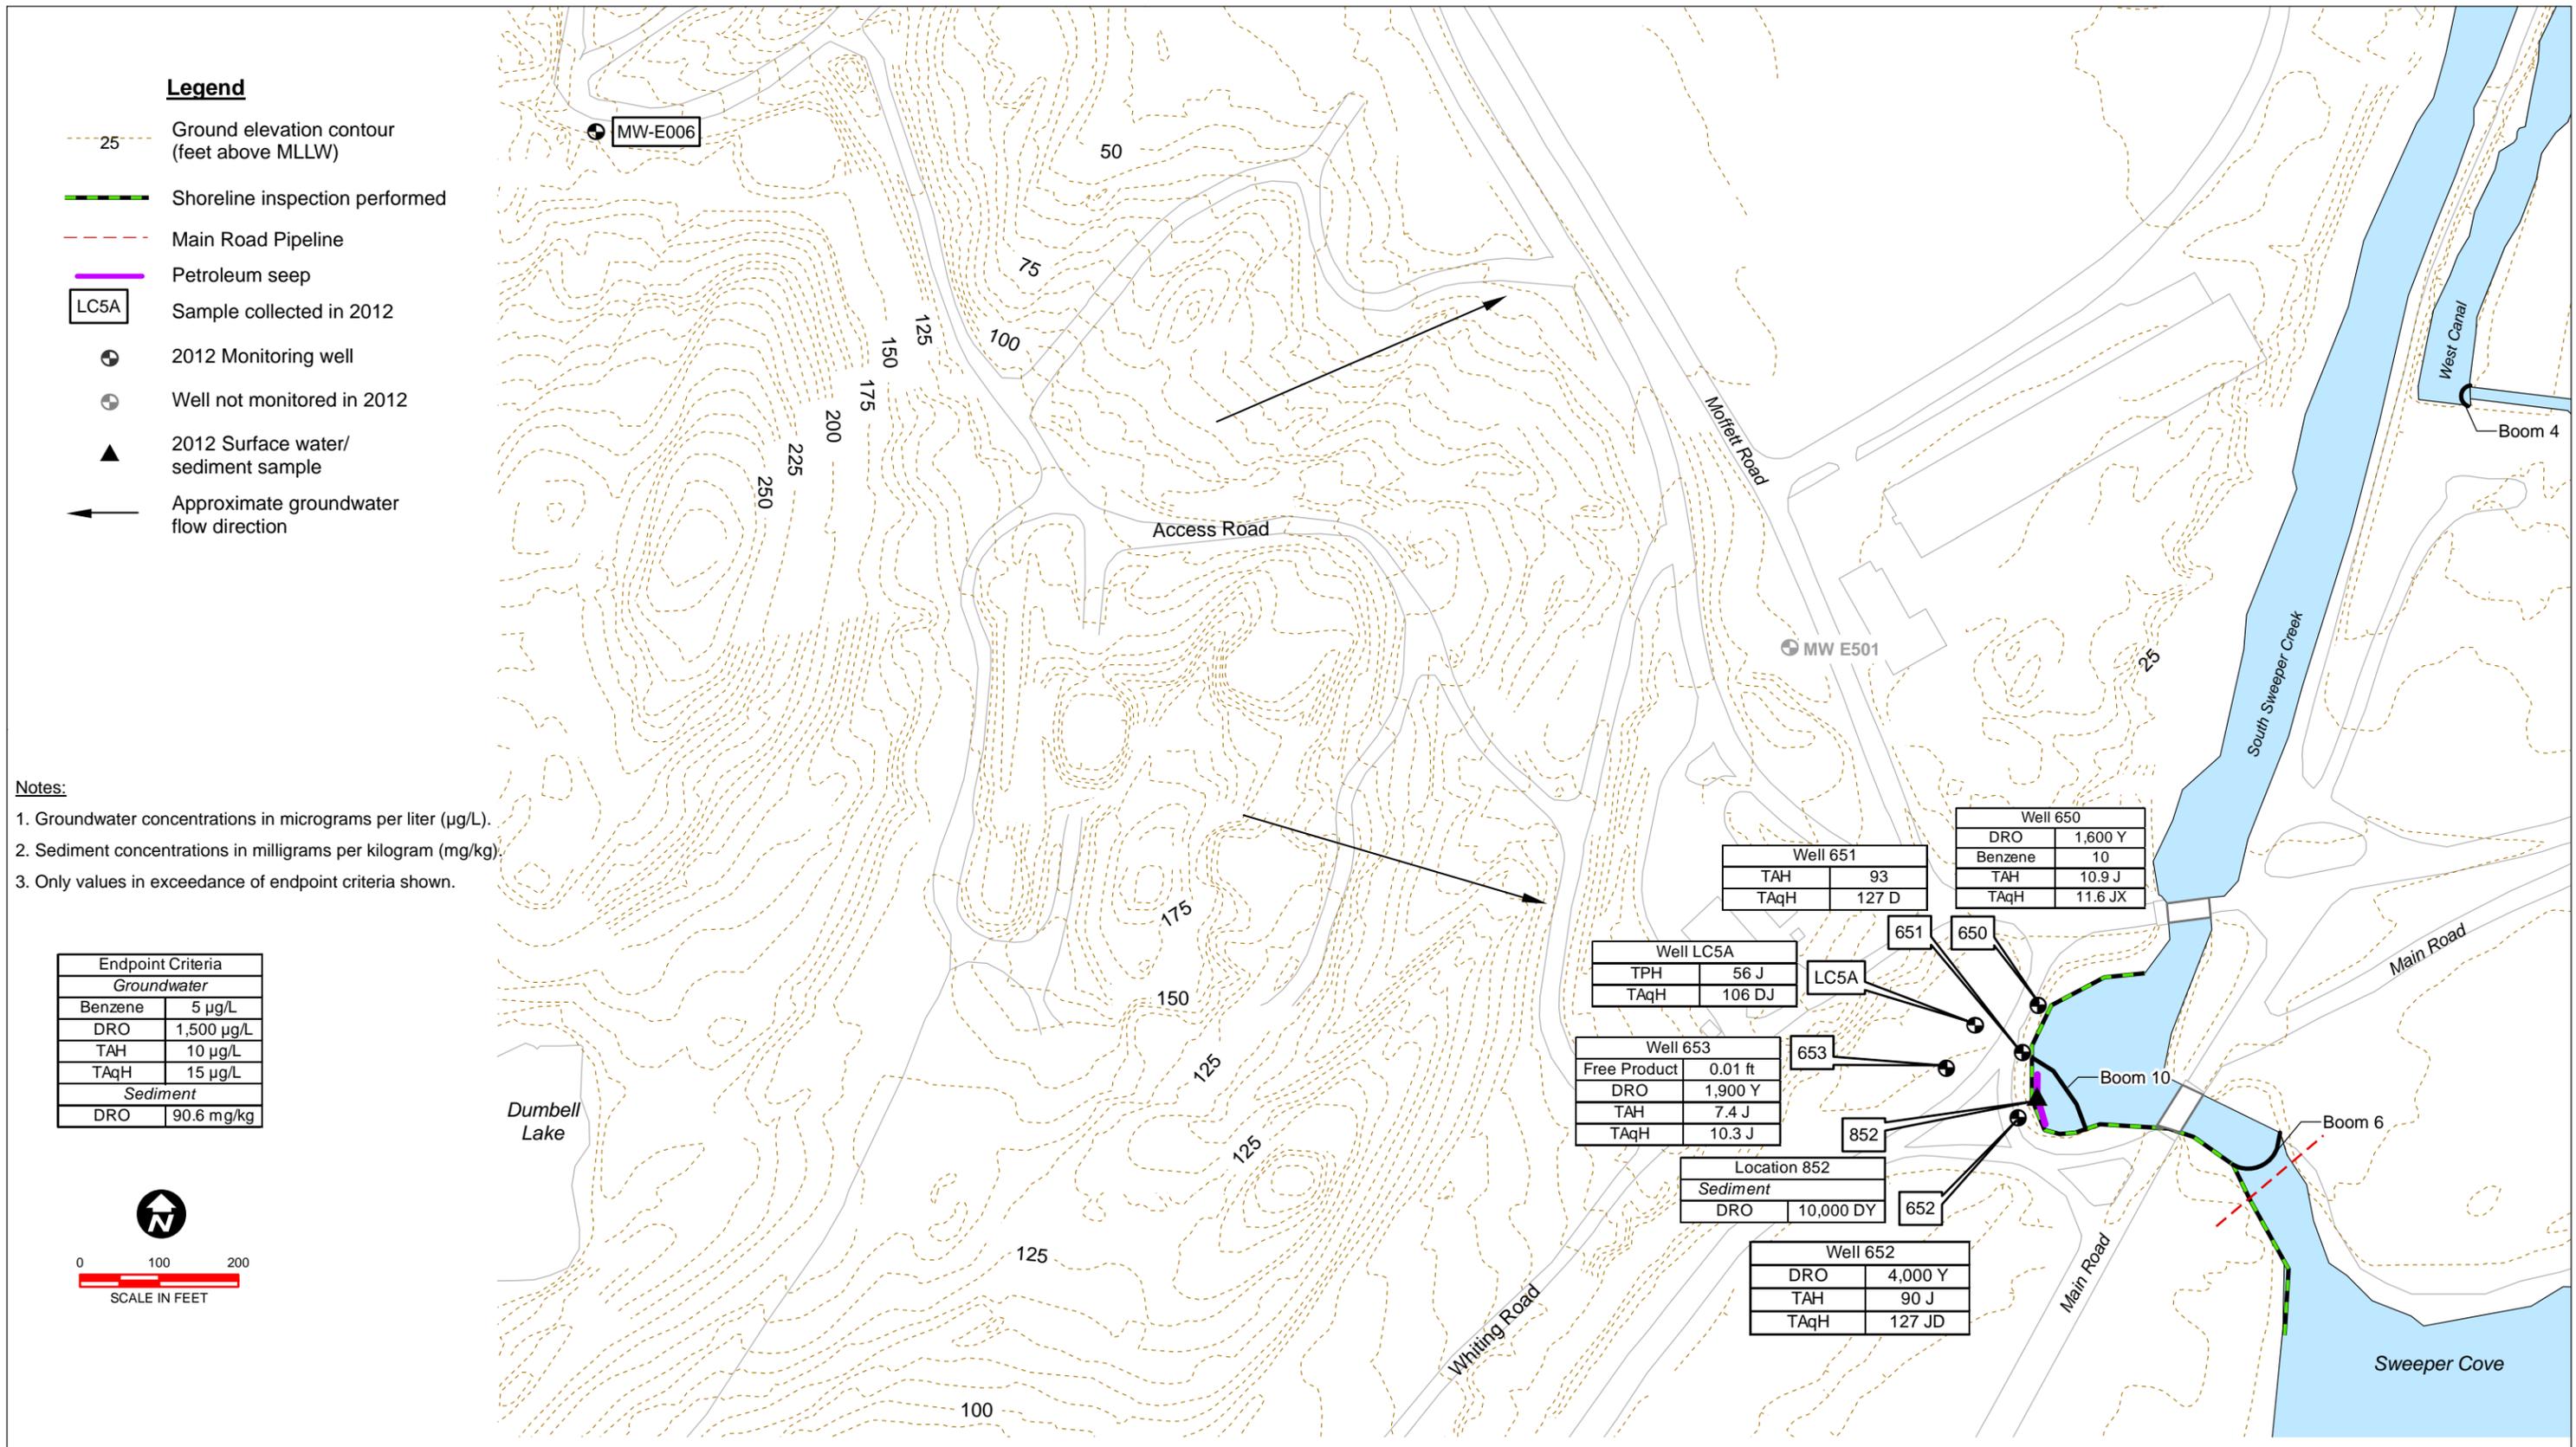

- Groundwater Flow: The groundwater flow direction in the upland area appears to follow site topography and flow directly southeast toward South Sweeper Creek in the lowland area.
- MNA: The groundwater parameters obtained during the 2012 LTM event provide evidence that natural attenuation of petroleum hydrocarbons continues to occur at the site.
- Free product was observed in well 653 at thicknesses of 0.01 feet. A total of 0.20 gallons of free product was removed from the site during October 2011 through September 2012.
- Well 650: This well is located within the contaminant plume. The DRO and benzene concentrations were observed at concentrations of 1,600 µg/L and 10 µg/L, respectively, which were above endpoint criteria. TAH and TAqH concentrations in groundwater were above ADEC water quality standards at 10.0 µg/L and 11.6 µg/L, respectively. Toluene, ethylbenzene, and total xylene concentrations were all below endpoint criteria.
- Well 651: This well is located within the contaminant plume. The DRO and BTEX concentrations were observed at concentrations below endpoint criteria. TAH and TAqH concentrations in groundwater exceeded ADEC water quality standards at 93 µg/L and 127 µg/L, respectively.
- Well 652: This well is located within the contaminant plume. DRO was observed at a concentration of 4,000 µg /L which was above endpoint criteria. TAH and TAqH concentrations in groundwater were above ADEC water quality standards at 90 µg/L and 127 µg/L, respectively. BTEX concentrations were all below endpoint criteria.

- Well 653: This well is located within the contaminant plume. The DRO was observed at a concentration of 1,900 µg /L which was above endpoint criteria. TAH and TAqH concentrations in groundwater were above ADEC water quality standards at 7.4 µg/L and 10.3 µg/L, respectively. BTEX concentrations were all below endpoint criteria.
- Well LC5A: BTEX concentrations were observed below endpoint criteria for the fifth consecutive sampling event in this downgradient well. TAH and TAqH concentrations in groundwater exceeded ADEC water quality standards at 56 µg/L and 106 µg/L, respectively.
- Well MW-E006: The benzene concentration dropped below the endpoint criteria in 2012, at a concentration of 4.7 µg/L. The analysis indicates a statistically significantly decreasing trend in benzene concentration at the 80 and 95 percent confidence level.
- Sample location 852: Surface water and sediment were collected at the observed petroleum seep in South Sweeper Creek downgradient of the site. No contaminant of concern exceeded endpoint criteria in the surface water. This may have been because the surface water was collected approximately 75 feet downgradient from the sediment sample location at the seep due to low tide conditions. DRO exceeded the endpoint criteria in sediment at this location in 2012 at a concentration of 10,000 µg/L. This is an increase compared to the 2011 concentrations which was 1,400 mg/kg. Indeno(1,2,3-cd)pyrene, TAH, and TAqH remained below their respective surface water endpoint criteria and have been below the criteria for six consecutive sampling events. 2-Methylnaphthalene dropped below the sediment endpoint criteria in 2012. This contaminant exceeded sediment endpoint criteria in both 2010 and 2011. Phenanthrene remained below its respective sediment endpoint criteria; however, the method detection limit was elevated above the endpoint criteria due to matrix interferences. Phenanthrene has remained below the sediment endpoint criteria for five consecutive sampling events.
- A petroleum seep is located downgradient of well 652 on the northwestern shoreline of South Sweeper Creek lagoon. Adsorbent booms are being maintained monthly at this location to control sheen on surface water from the shoreline petroleum seep. Oily sediments, strong petroleum odor, sheen, and iron staining was observed behind the boom.

## **19.6 RECOMMENDATIONS**

The benzene concentration in upland well MW-E006 dropped below endpoint criteria in 2012 and exhibits a statistically significant decreasing trend. TAH and TAqH have continued to exceed endpoint criteria at well LC5A since sampling began in 2008. However, BTEX concentrations have remained below endpoint criteria since 2008. Therefore, it is recommended that monitoring at these locations be reduced to every odd year with the next sampling to occur in 2013. This is consistent with the CMP, Revision 5 (Navy 2012e) to align all biennial sampling to odd year sampling.

Because natural attenuation is progressing at this site and because past monitoring has shown incremental changes to the site, it is recommended that all other monitoring at this site continue as prescribed. If 2013 monitoring results continue to show only incremental changes to previous years' results, it is recommended that monitoring at the site be reduced to every odd year.

2012 Annual Groundwater  
Monitoring Report

## **20. SWMU 61, TANK FARM B**

This section presents the results of groundwater monitoring performed at the SWMU 61, Tank Farm B site during 2012. The remedy specified for this site in the OU A ROD is MNA (Navy et al. 2000). To comply with requirements specified for this remedy, the Navy has conducted periodic groundwater sampling and water level/product thickness monitoring at the site. Groundwater samples have been collected from wells to evaluate groundwater quality relative to Alaska groundwater cleanup levels (18 AAC 75.345), to verify that natural attenuation is occurring in groundwater, to verify that natural recovery is occurring in surface water and sediment, and to monitor for surface water protection.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, a discussion of natural attenuation conditions, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, trend evaluation analyses for historical target analyte concentration data, conclusions based on these analyses, and recommendations for future monitoring activities at the site.

### **20.1 FIELD MEASUREMENTS**

The monitoring wells were gauged and sampled on September 1, 2012. Depth-to-water and product thickness measurements were collected at three monitoring wells. Table 20-1 provides the measured depths to groundwater and the calculated groundwater elevations. No free product was detected in any of the site wells. Figure 20-1 shows the locations of the wells, analytical results that exceeded endpoint criteria, site topography and features, and potential sources of contamination (e.g., fuel lines).

The site is divided into two areas of upper and lower elevations. The upper elevation part of the site is underlain by a relatively thin layer of tephra and glacial till overlying bedrock, while the lower elevation part is underlain by the western edge of a sandy aquifer. Water level data and the hydrogeologic setting of the site indicate that the groundwater flows southeast following site topography in the upland area and directly east toward North Sweeper Creek in the lowland area.

**Table 20-1.** 2012 Field Measurements for SWMU 61, Tank Farm B

Physical Measurements					Water Quality Parameters						
Well Location	Casing Elevation (ft MLLW)	Depth-to-Water (ft BTOC)	Groundwater Surface Elevation (ft MLLW)	Measured Product Thickness (ft)	pH (SU)	Specific Conductance (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Temperature (°C)	Salinity (%)	ORP (mV)

<i>Notes:</i>											
The reported casing elevation is the surveyed elevation residing in the NIRIS database.											
The last groundwater parameter measurement prior to sample collection is reported.											

20-2

Three wells were sampled on September 1 and 6, 2012. Field measurements were recorded on field data forms and logbooks during monitoring well sampling activities (Appendix A). Table 20-1 lists the final field measurements recorded at each water sampling location prior to sample collection. A review of the sampling data reported for the site indicates that groundwater parameters at well TFB-MW-4B stabilized prior to sample collection. The parameters at wells 14-113 and 14-210 did not stabilize, so three well casing volumes were removed from each of these wells prior to sampling per CMP Revision 5 (Navy 2012e). The 2012 analytical results in these wells are consistent with past analytical results and appear to be unaffected by the lack of stabilization.

On September 6, 2012, two surface water and sediment samples (locations NL-04 and NL-D-04) were collected from the western shoreline of North Sweeper Creek downgradient of monitoring well 14-113 (Figure 20-1) to determine whether petroleum contamination from groundwater is impacting surface water. Sample NL-04 was collected immediately downgradient of well 14-113. Sample NL-D-04 was collected approximately 70 feet downstream of NL-04 but upgradient of the confluence with an unnamed stream (Figure 20-1). It should be noted that these samples were collected from a swampy wetland. Both sediment samples contained high moisture content that resulted elevated method detection limits.

An inspection of the western shoreline of North Sweeper Creek was performed in 2012 at site SWMU 61, Tank Farm B between monitoring well 14-113 and the confluence with an unnamed stream approximately 100 feet to the north. This inspection was performed because in 2010 groundwater exceeded endpoint criteria in surface water protection for well 14-113 and in sediment at locations NL-04 and NL-D-04. No evidence of petroleum contamination was observed during the inspection or during collection of samples from locations NL-04 and NL-D-04. Shoreline inspection information is also summarized in Section 4.

## **20.2 TARGET ANALYTE RESULTS**

The following sections describe the analytical results for each medium sampled in 2012. Historical analytical results obtained for these locations are summarized in Appendix C. Laboratory reports presenting the 2012 results are provided in Appendix F.

### **20.2.1 Groundwater**

The groundwater samples collected from wells 14-113, 14-210, and TFB-MW4B were analyzed for GRO and BTEX. The groundwater sample from surface water protection monitoring well 14-113 was also analyzed for PAHs. TAH and TAqH results for well 14-113 were calculated from the BTEX and PAH results. Groundwater analytical results were compared to the endpoint criteria for groundwater at petroleum-release sites presented in Appendix F or the CMP, Revision 5 (Navy 2012e). Table 20-2 presents the groundwater analytical results.

GRO was detected above the endpoint criteria (1,300 µg/L) in the samples collected from wells 14-113 (2,000 µg/L), 14-210 (2,400 µg/L), and TFB-MW4B (36,000 µg/L). Benzene was detected above the endpoint criteria (5 µg/L) in the samples collected from wells 14-113 and TFB-MW4B at concentrations of 6.9 µg/L and 24 µg/L, respectively.

**Table 20-2.** Analytical Results for Petroleum-Related Chemicals for Groundwater Samples at SWMU 61, Tank Farm B

Endpoint Criteria		1,300	5	1,000	700	10,000	10 <sup>3</sup>	15 <sup>3</sup>

Notes:

<sup>1</sup> TAH results were calculated by summing the detected concentrations of BTEX when one or more were detected and by summing the reporting limits when none were detected.

<sup>2</sup> TAqH results were calculated by summing the detections of BTEX and 16 PAHs when one or more were detected and by summing the reporting limits when none were detected.

<sup>3</sup> ADEC water quality standard as specified in 18 AAC 70.

**Bold** indicates reported concentration is greater than the endpoint criteria or water quality standard.

Groundwater collected from well TFB-MW4B also exceeded endpoint criteria with the observed concentrations of toluene (4,800 µg/L), ethylbenzene (2,100 µg/L), and total xylenes (15,600 µg/L). TAH and TAqH were detected above the endpoint criteria (10 µg/L and 15 µg/L, respectively) in the sample collected from surface water protection well 14-113 both at a concentration of 704 µg/L.

### 20.2.2 Surface Water

The surface water samples collected at locations NL-04 and NL-D-04 were analyzed for GRO, BTEX, and PAHs (for calculation of TAH and TAqH). Surface water analytical results were compared to CMP, Revision 5 (Navy 2012e) South Sweeper Creek endpoint criteria and State of Alaska surface water criteria. Table 20-3 presents the surface water analytical results.

**Table 20-3.** Analytical Results for Petroleum-Related Chemicals in Surface Water at SWMU 61, Tank Farm B

Location	Year	GRO (µg/L)	Total Aromatic Hydrocarbons <sup>1</sup> (µg/L)	Total Aqueous Hydrocarbons <sup>2</sup> (µg/L)
NL-04	2007	100 U	0.36 J	0.36 J
	2008	100 U	0.23 J	0.23 J
	2009	100 U	2.5 U	0.048
	2010	16 J	0.35 J	0.35 J
	2011	100 U	0.59 J	0.60 J
	2012	100 U	1.2 J	1.2 J
NL-D-04	2009	26 J	2.5 U	2.85 U
	2010	100 U	2.5 U	2.86 U
	2011	100 U	0.53 J	0.53 J
	2012	100 U	0.19 J	0.23 J
Endpoint Criteria <sup>3,4</sup>		114	10	15

Notes:

<sup>1</sup>TAH results were calculating by summing the detected concentrations of BTEX when one or more were detected and by summing the reporting limits when none were detected.

<sup>2</sup>TAqH were calculated by summing the detections of BTEX and 16 PAHs when one or more were detected and by summing the reporting limits when none were detected.

<sup>3</sup>TAH and TAqH endpoint criteria are based on the ADEC water quality standard as specified in 18 AAC 70.

<sup>4</sup>Endpoint criteria for North Sweeper Creek have not been established so endpoints for South Sweeper Creek were used.

DRO, GRO, TAH, and TAqH were not detected above surface water endpoint criteria or water quality standards (250 µg/L, 114 µg/L, 10 µg/L, and 15 µg/L, respectively) at any surface water sample location.

### 20.2.3 Sediment

Sediment samples collected at NL-04 and NL-D-04 were analyzed for GRO and BTEX. Sediment analytical results were compared to CMP, Revision 5 (Navy 2012e) South Sweeper

Creek endpoint criteria. Table 20-4 presents the sediment analytical results. GRO and BTEX were not detected in either sediment sample; however, the GRO method detection limits for these samples exceeded the 12.2 mg/kg endpoint criteria due to high water content in the samples.

**Table 20-4.** Analytical Results for Petroleum-Related Chemicals in Sediment Samples at SWMU 61, Tank Farm B

Location	Year	GRO (mg/kg)	Benzene (mg/kg)	Toluene (mg/kg)	Ethylbenzene (mg/kg)	Total Xylenes (mg/kg)
NL-04	2007	2.8 UJ	0.012 U	0.012 U	0.012 U	0.035 U
	2008	<b>300 ZJ</b>	0.058 J	0.24 U	0.27	26 J
	2009	<b>13 J</b>	0.066 U	0.066 U	0.066 U	0.062 J
	2010	<b>60 J<sup>1</sup></b>	0.70 U	0.70 U	0.70 U	1.4 U
	2011	<b>16 U<sup>2,3</sup></b>	0.50 U	0.50 U	0.50 U	1.0 U
	2012	<b>20 U<sup>2,3</sup></b>	0.67 UJ	0.67 UJ	0.67 UJ	1.3 UJ
NL-D-04	2009	<b>16 U<sup>2,3</sup></b>	0.22 U	0.22 U	0.22 U	0.096 J
	2010	<b>24 U<sup>2,3</sup></b>	0.72 UJ	0.72 UJ	0.72 UJ	1.4 UJ
	2011	<b>26 U<sup>2,3</sup></b>	0.78 U	0.78 U	0.78 U	1.6 U
	2012	<b>27 U<sup>2,3</sup></b>	0.90 UJ	0.90 UJ	0.90 UJ	1.8 UJ
Endpoint Criteria <sup>4</sup>		12.2	None	None	None	None

<sup>1</sup>Value is reported from the field duplicate sample because the sample result was a non-detect with a method reporting limit greater than the endpoint criteria.

<sup>2</sup>Value is the method detection limit because the reporting limit is greater than the risk-based endpoint criteria.

<sup>3</sup>Method detection limit is elevated due to high moisture in the sample.

<sup>4</sup>Endpoint criteria for North Sweeper Creek have not been established so endpoints for South Sweeper Creek were used.

**Bold** indicates reported concentration is greater than the endpoint criteria.

### 20.3 MONITORED NATURAL ATTENUATION

NAPs were collected at this site in 2009 to determine whether natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data indicated that biodegradation of petroleum hydrocarbons is occurring by iron (II) reduction; sulfate reduction; and methanogenesis as shown by elevated ferric iron concentrations, depleted sulfates, and elevated methane concentrations in comparison to background conditions. A large, riverine wetland is located along the shoreline of North Sweeper Creek and fills the flat bed of the stream valley below the site. Wetland methanogenesis occurs here which is caused by the microbiological degradation of naturally occurring organic matter in saturated surface soils, resulting in a geochemical signature that may be indistinguishable from petroleum hydrocarbon degradation. Wetland methanogenesis is suspected to occur at the low-lying sample location (wells 14-113 and 14-210 and surface water/sediment locations NL-04 and NL-D-04).

The groundwater parameters presented in Table 20-1, which were collected during the 2012 LTM event, support evidence of continued natural attenuation as shown by the reducing environment (negative ORP) and low dissolved oxygen concentrations (0 mg/L) in the upland onsite source area well TFB-MW4B, where the wetland does not occur.

It should be noted that wetland methanogenesis will not prevent petroleum degradation from occurring but may obscure the ability to monitor its occurrence. A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

## 20.4 TREND EVALUATION

Statistical trend evaluations were conducted for target analyte concentrations in groundwater in accordance with the CMP, Revision 5 (Navy 2012e). Trend evaluation is conducted for only analytes that exceeded the endpoint criteria within the last two sampling events and had a minimum of four data points. Results of the Mann-Kendall and Sen's trend evaluations are summarized in Table 20-5. Worksheets and graphs are provided in Appendix H.

The following are the results of the statistical evaluation:

- Well 14-113:
  - GRO exhibits a decreasing trend at the 80 percent confidence interval. The Sen's evaluation for GRO did not show a statistically significant decreasing trend.
  - Benzene exhibits a decreasing trend at both the 80 and 95 percent confidence intervals with a Sen's evaluation indicating a statistically significant decreasing trend with a median slope of -2.99.
- Well 14-210: GRO exhibits no trend at either the 80 or 95 percent confidence interval. The coefficient of variation indicates a stable concentration.
- Well TFB-MW4B:
  - GRO exhibits no trend at both the 80 or 95 percent confidence intervals and a stable concentration.
  - The benzene concentration exhibits a decreasing trend at both the 80 and 95 percent confidence intervals. Sen's evaluation also indicates a statistically significant decreasing trend, with a median slope of -2.94.
  - The toluene and ethylbenzene concentrations exhibit no trend at either the 80 or 95 percent confidence intervals. The coefficient of variation indicates the concentrations are stable.
  - The total xylenes concentration exhibits an increasing trend at both the 80 and 95 percent confidence intervals.

**Table 20-5.** Concentration Trend Evaluation for SWMU 61, Tank Farm B

Well	Target Analyte	Exceeds Endpoint Criteria	Highest Concentration Last Two Sampling Periods (µg/L)	Endpoint Criteria <sup>1</sup> (µg/L)	Sampling Periods (n)	Mann-Kendall Statistic (S)	Mann-Kendall Trend			Sen's Slope 2-Tailed Test at 80% C.I.			
							Trend at 80% C.I.	Trend at 95% C.I.	Concentration Stability <sup>2</sup>	Median Slope	Statistically Significant Trend	Lower Limit	Upper Limit
14-113	GRO	Yes	3,400 Y	1,300	10	-15	Decreasing	No trend	NA	-290	No	-580	0
	Benzene	Yes	8.3	5	10	-41	Decreasing	Decreasing	NA	-2.99	Yes	-3.5	-2.0
14-210	GRO	Yes	2,400 Y	1,300	10	-5	No trend	No trend	Stable	NC	NC	NC	NC
TFB-MW4B	GRO	Yes	51,000 DY	1,300	10	5	No trend	No trend	Stable	NC	NC	NC	NC
	Benzene	Yes	24 D	5	10	-36	Decreasing	Decreasing	NA	-2.94	Yes	-4.0	-1.6
	Toluene	Yes	4,800 DJ	1,000	10	-5	No trend	No trend	Stable	NC	NC	NC	NC
	Ethylbenzene	Yes	2,100 D	700	10	10	No trend	No trend	Stable	NC	NC	NC	NC
	Total Xylenes	Yes	15,600 D	10,000	10	25	Increasing	Increasing	NA	NC	NC	NC	NC

Notes:

<sup>1</sup> Endpoint criteria are established from risk-based cleanup levels.

<sup>2</sup> Concentration Stability determined from the coefficient of variation when no trend exists at the 80% confidence interval (C.I.).

Sen's Slope is calculated for target analytes with decreasing concentration trends only.

## 20.5 CONCLUSIONS

This section presents the conclusions based on a review of monitoring performed at the SWMU 61, Tank Farm B site in 2012. The conclusions are as follows:

- **Groundwater Flow:** The groundwater flow direction is to the southeast in the upland area and appears to follow the site topography. Groundwater flows directly east toward North Sweeper Creek in the lowland area.
- **MNA:** The groundwater parameters obtained during the 2012 LTM event provide evidence that natural attenuation of petroleum hydrocarbons continues to occur at the site.
- **Product** was not observed in any well at the site in 2012.
- **Well 14-113:** GRO and benzene have been detected above the endpoint criteria since 2003. The GRO concentration exhibited a statistically significant decreasing trend for the first time in 2012. Benzene also exhibits a statistically significant decreasing trend at both the 80 and 95 percent confidence intervals. TAH and TAqH have both exceeded endpoint criteria since sampling began in 2007. Toluene, ethylbenzene, and total xylenes have remained below endpoint criteria since 2003. This well, which represents downgradient conditions, is completed within the wetland and is located adjacent to North Sweeper Creek.
- **Well 14-210:** GRO has been detected above the endpoint criteria since 2001 and exhibits a stable concentration in this downgradient well. BTEX has remained below endpoint criteria since 2002. This well is located at the base of the hill between the plume source area and North Sweeper Creek, and it is completed within the wetland.
- **Well TFB-MW4B:** GRO and BTEX have been detected above the ADEC endpoint criteria since 2001 (with the exception of total xylenes, which were below the endpoint criteria in 2001 and 2002). Based on the results of statistical analysis, the benzene concentration is decreasing, with statistical significance at the 95 percent level of confidence. Total xylene concentrations show increasing concentration trends. GRO, ethylbenzene, and toluene concentrations are stable. It should be noted that ethylbenzene concentrations exhibited increasing trends in 2011.

- Sample location NL-04: Surface water and sediment samples were collected immediately downgradient of well 14-113 in North Sweeper Creek. Surface water has not exceeded the endpoint criteria since sampling began in 2007. GRO was undetected in sediment, but the method detection limit exceeded the endpoint criteria due to high water content in the sample. No petroleum odor or sheen was observed when sediment was disturbed during sampling activities.
- Sample location NL-D-04: Surface water and sediment samples were collected approximately 70 feet downgradient of NL-04. GRO was undetected in sediment, but the method detection limit exceeded the endpoint criteria due to high water content in the sample. BTEX was not detected in the sediment. No petroleum odor or sheen was observed when sediment was disturbed during sampling activities.
- A shoreline inspection of North Sweeper Creek revealed no observed petroleum contamination.

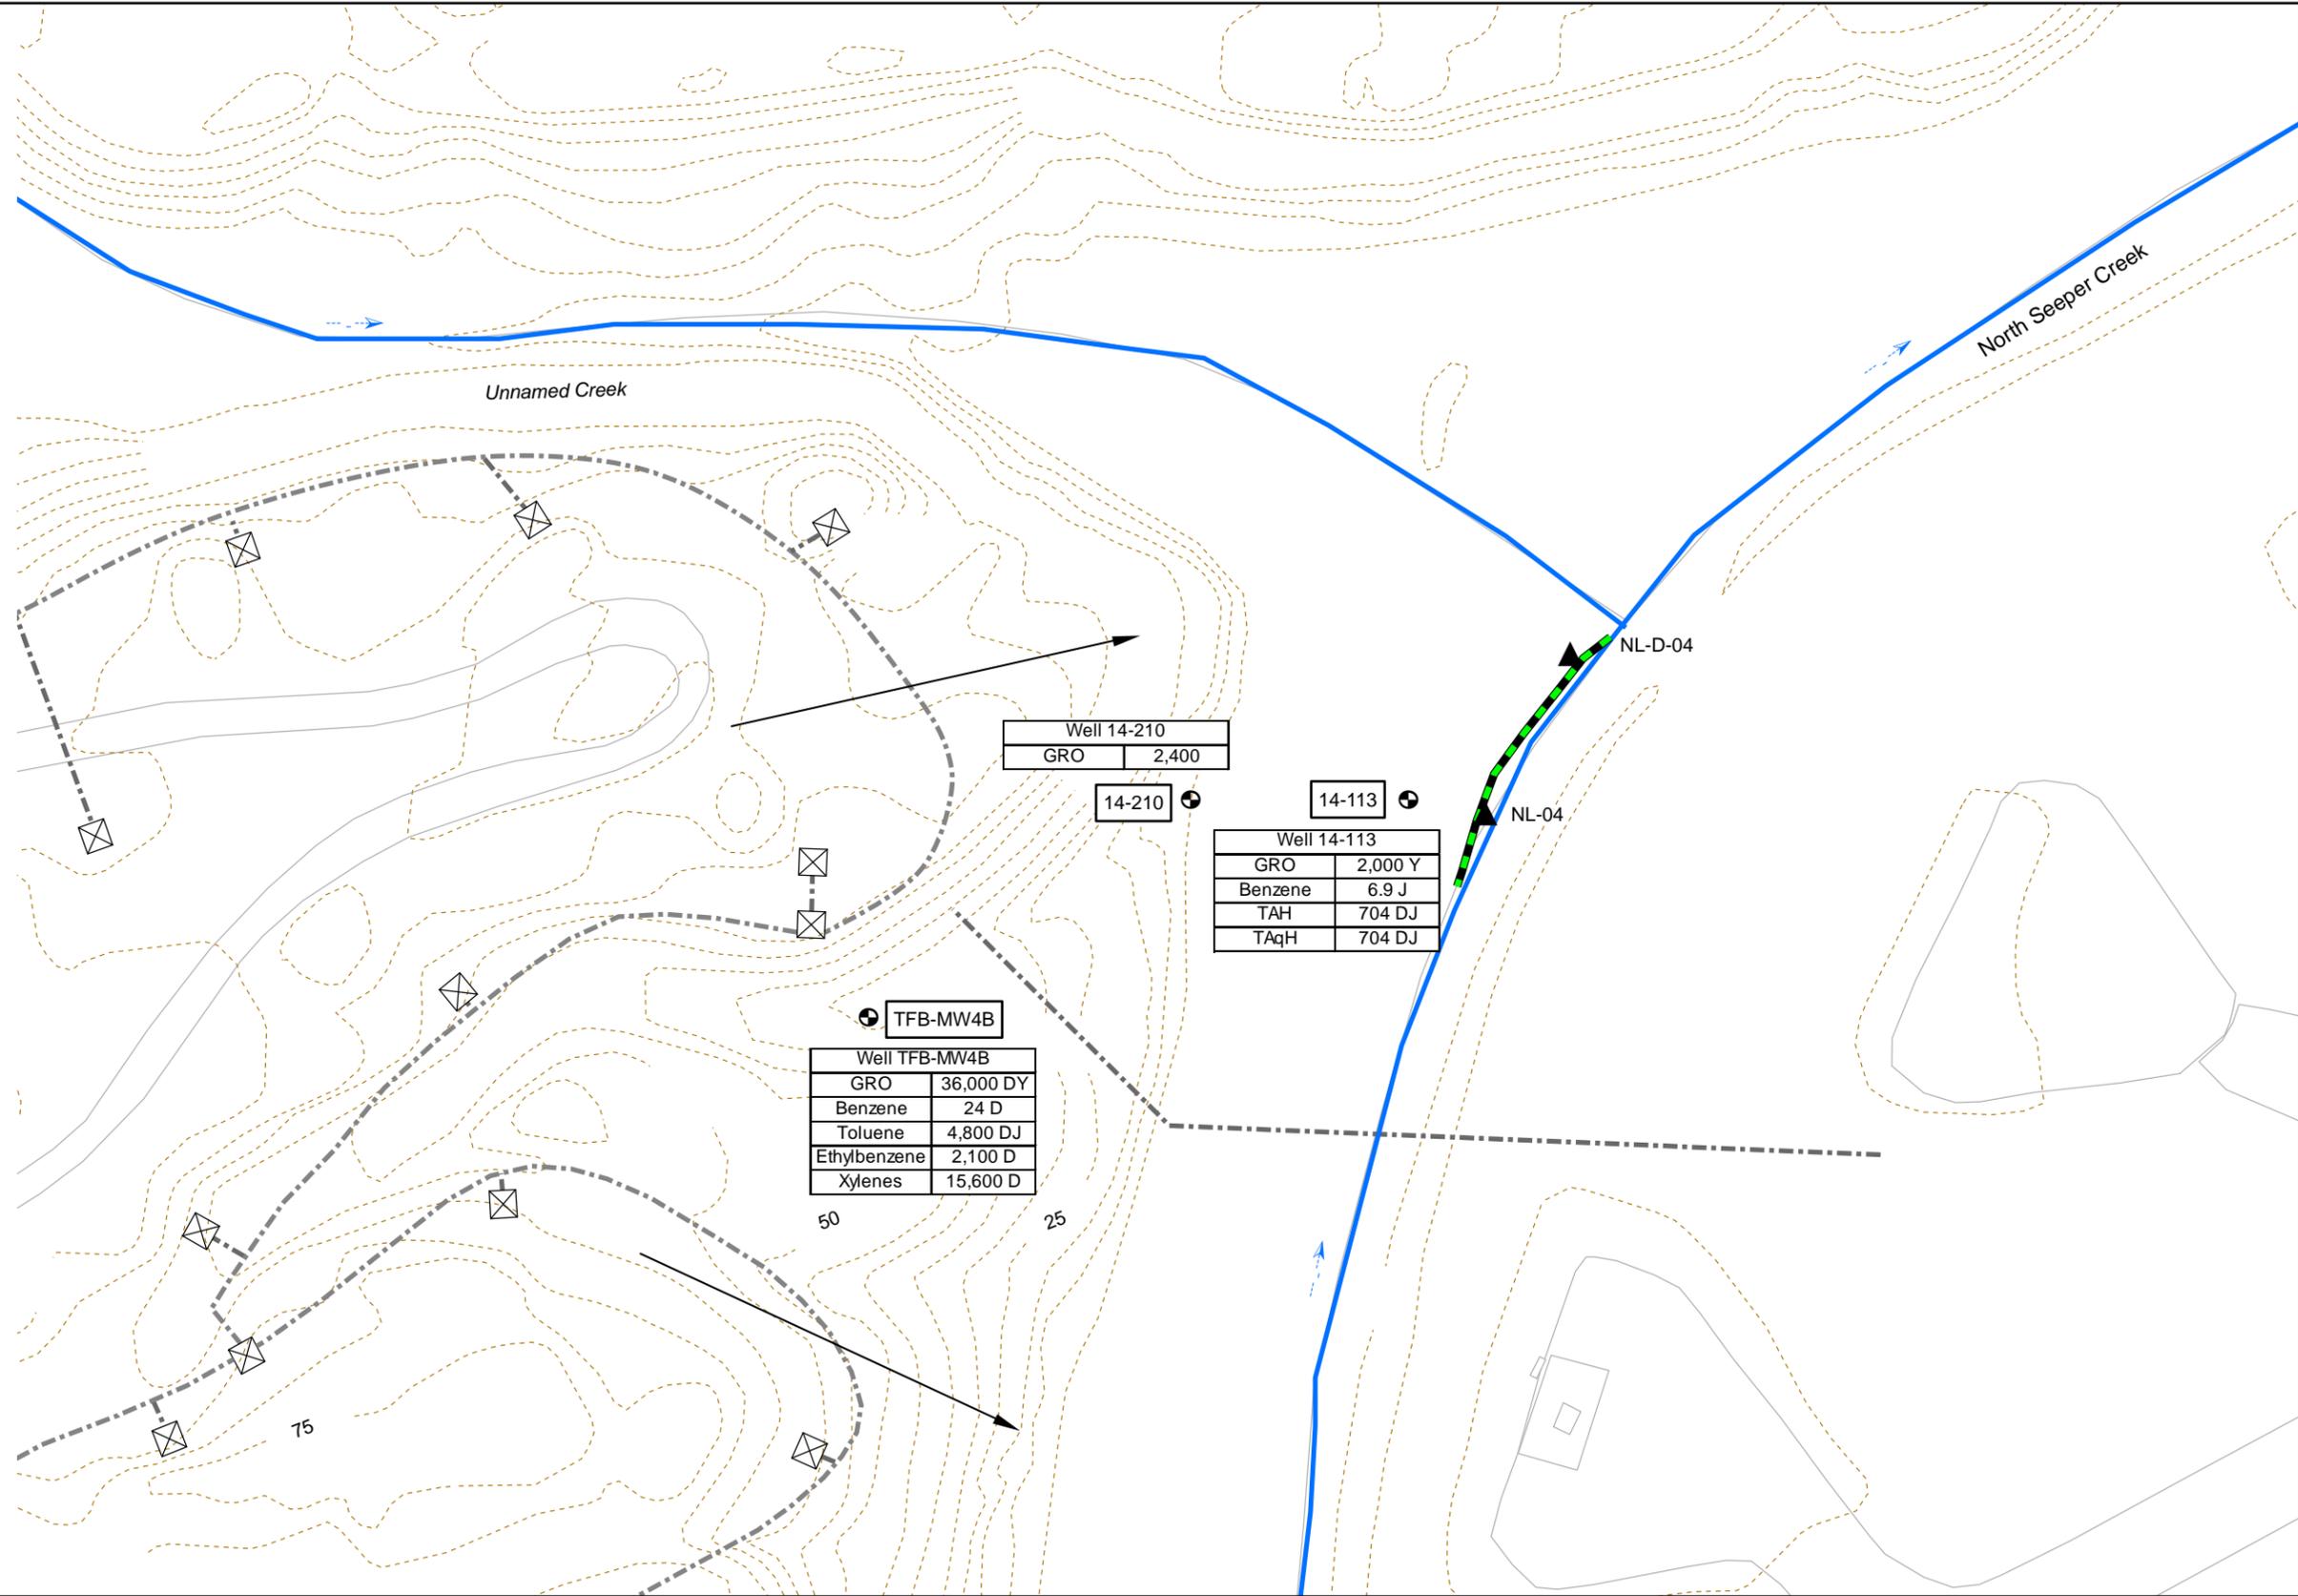

## 20.6 RECOMMENDATIONS

Surface water and sediment samples collected from NL-04 and NL-D-04 did not exceed any endpoint criteria. Because concentrations of GRO and benzene continue to exceed endpoint criteria in surface water protection well 14-113, it is recommended that monitoring at immediately downgradient location NL-04 continue. However, because surface water and sediment have not exceeded GRO or BTEX endpoint criteria for four consecutive sampling events, it is recommended that sampling at NL-D-04 be discontinued.

GRO, BTEX, TAH, and TAqH concentrations in groundwater collected from monitored wells at this site remain above their respective endpoint criteria. However, evidence that natural attenuation is progressing is evidenced by the change in the GRO trend in downgradient well 14-113 from stable in 2011 to decreasing in 2012. Additional evidence includes the change in the ethylbenzene trend in plume well TFB-MW4B from increasing in 2011 to stable in 2012. Because of this, it is recommended that all monitoring at this site continue every odd year with the next monitoring in 2013 to allow attenuation to effect a change. This is consistent with the CMP, Revision 5 (Navy 2012e) to align all biennial sampling to odd year sampling.

Monitoring Report

## **21. SWMU 62, NEW HOUSING FUEL LEAK**

This section presents the results of groundwater monitoring performed at the SWMU 62, New Housing Fuel Leak site during September 2012. The remedy specified for this site in the OU A ROD is free product recovery (Navy et al. 2000). Additional post free product recovery and MNA remedy are specified in the Final Decision Document for SWMU 62, New Housing Fuel Leak (Navy 2006b). To comply with requirements specified for this remedy, the Navy has conducted annual groundwater sampling and water level/product thickness monitoring at the site. Groundwater samples are collected from wells at the site to evaluate groundwater quality relative to Alaska groundwater cleanup levels (18 AAC 75.345), to determine whether natural attenuation is occurring, and to monitor for surface water protection.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, a discussion of natural attenuation conditions, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, trend evaluation analyses for historical target analyte concentration data, conclusions based on these analyses, and recommendations for future monitoring activities at the site.

### **21.1 FIELD MEASUREMENTS**

Depth-to-water and product thickness measurements were collected at 47 monitoring wells at Sandy Cove on September 8, 2012 and at Eagle Bay on September 10, 2012. Seventeen of the wells are located in the Sandy Cove Housing 102, 107, and 146 Areas, and 30 wells are located in the Eagle Bay Housing Complex. Table 21-1 provides the measured depths to water (corrected for product thickness, if present), the calculated groundwater elevations, and the product thicknesses if present. Groundwater elevations have been corrected for the presence of free product in the wells with detectable thicknesses (Appendix D). Figures 21-1 and 21-2 show the locations of the wells in Sandy Cove and Eagle Bay Housing, respectively, relative to the site features, the site topography, and the interpreted groundwater flow direction.

The water level data indicate that the direction of groundwater flow in the main aquifer beneath the site is to the west-southwest beneath Sandy Cove and to the west-northwest toward East Canal beneath Eagle Bay. Well MRP-MW3 is located in a localized shallow perched aquifer within the western diesel and gasoline plume.

21-3

Twenty-two wells were sampled for petroleum contaminants between September 7 and 11, 2012. Surface water protection monitoring was performed at six well locations in Eagle Bay: 03-109, 03-898, AMW-704, RW-303-13, RW-303-14, and RW-303-16. To assess the effectiveness of the sorbent booms maintained in East Canal, one surface water/sediment sample (NL-09) was collected in East Canal on September 11, 2012 downgradient of the free product recovery trench and booms. Field measurements were recorded on the field forms and logbooks during monitoring well sampling activities (Appendix A). Table 21-1 lists the final field measurements recorded at each monitoring well prior to sample collection.

A review of the sampling data reported for the site indicates that parameters from six wells (03-155, 03-502, 03-802, MW-134-11, MW-187-1, MRP-MW2, and RW-303-14) did not stabilize and were sampled after three well volumes were removed. The 2012 analytical results in these wells are generally consistent with past analytical results and appear to be unaffected by the lack of stabilization.

Free product was not detected in any well in 2012. Monthly free product recovery activities were performed in the Eagle Bay Housing area at this site during October 2011 through September 2012. A total of 6.21 gallons of free product was recovered from the site during this time frame. Additionally, oil-adsorbent booms (booms 2, 3, and 8) are being maintained monthly in East Canal at the petroleum shoreline seep located immediately downgradient of the site's product recovery trench. Monthly free product recovery activities for this site are summarized in Appendix J and the Remedial Action Summary Report, Free Product Recovery, Adak (Navy 2012f).

A visual inspection of the East Canal shoreline was conducted to identify potential petroleum migration from groundwater to East Canal. The eastern shoreline of East Canal was inspected from the SWMU 62, New Housing Fuel Leak Area product recovery trench to the culvert at boom location 9/12 downgradient from the Former Power Plant, Building T-1451 site. A large petroleum seep, approximately 120 feet in length, is located along the eastern canal shoreline immediately downgradient of the free product recovery trench. Oily sediments, pooled free product, surface water sheen, petroleum odor, stressed vegetation, and iron staining were observed at this location. Results of the visual shoreline inspections are summarized in Section 4.1.3.

## **21.2 TARGET ANALYTE RESULTS**

All 13 groundwater samples collected from Sandy Cove wells were analyzed for DRO. Five of these samples were also analyzed for GRO and BTEX. One sample, collected from MW-187-1 was also analyzed for benzene. All nine groundwater samples collected from Eagle Bay

wells were analyzed for DRO. One of these samples was also analyzed for GRO and BTEX. Tables 21-2 and 21-3 present the analytical results for Sandy Cove and Eagle Bay Housing Areas, respectively. Figures 21-1 and 21-2 show the locations of the wells sampled and the analytical results that exceeded endpoint criteria for the Sandy Cove and Eagle Bay Housing Areas, respectively. Historical analytical results obtained for these locations are summarized in Appendix C. Laboratory reports presenting the 2012 results are provided in Appendix F.

### **21.2.1 Sandy Cove Housing**

Eight of the 13 wells sampled (03-104, 03-155, 03-778, MRP-MW3, MW-107-1, MW 134-11, MW-146-1, and MW-187-1) had detections of DRO above the endpoint criteria (1,500 µg/L) at concentrations ranging from 1,600 µg/L (plume edge well 03-778) to 7,700 µg/L (plume well MW146-1).

GRO was detected above the endpoint criteria (1,300 µg/L) in two Sandy Cove Housing wells (MRP-MW2 and MRP-MW3) at concentrations of 2,900 µg/L and 31,000 µg/L, respectively. Benzene was detected above the endpoint criteria (5 µg/L) in one well, MRP-MW2, at a concentration of 35 µg/L. Toluene did not exceed the endpoint criteria (1,000 µg/L) at any of the wells sampled. Ethylbenzene (1,900 µg/L) and total xylenes (11,400 µg/L) were detected above their respective endpoint criteria of 700 µg/L and 10,000 µg/L and in well MRP-MW3.

### **21.2.2 Eagle Bay Housing**

Two of the nine wells sampled (MW-303-7 and RW 303-16) had DRO concentrations above the endpoint criteria (1,500 µg/L) at 14,000 µg/L and 2,700 µg/L, respectively. DRO did not exceed endpoint criteria in wells 03-103, 03-109, 03-502, 03-898, AMW-704, RW-303-13, and RW-303-14. GRO exceeded the endpoint criteria (1,300 µg/L) at well 03-502, at 3,400 µg/L. DRO and BTEX did not exceed their respective endpoint criteria in this well.

The surface water and sediment samples collected at location NL-09, located downgradient of the recovery trench boom in East Canal, were analyzed for DRO, GRO, BTEX, and PAHs (for calculation of TAH and TAqH). Because risk-based criteria have not been established for this site, surface water and sediment analytical results were compared to the South of Runway 18-36 endpoint criteria and State of Alaska surface water criteria. Tables 21-4 and 21-5 present the surface water and sediment analytical results, respectively.

Endpoint Criteria		1,500	1,300	5	1,000	700	10,000

Note:

**Bold** indicates reported concentration is greater than ADEC cleanup levels for groundwater used as a drinking water source.

Concentrations of GRO (150 µg/L), TAH (21.3 µg/L) and TAqH (21.5 µg/L) were detected in the surface water sample collected at location NL-09 above endpoint criteria of 114 µg/L, 10 µg/L, and 15 µg/L, respectively. DRO was detected at location NL-09 below endpoint criteria of 250 µg /L at a concentration of 110 µg /L. Indeno(1,2,3-cd)pyrene was not detected in the surface water sample.

DRO was detected in sediment sample NL-09 at 69 mg/kg, which is below the endpoint criteria of 90.6 mg/kg. GRO, BTEX, and target PAHs were not detected in this sample above their respective method detection limits.

**Table 21-4.** Analytical Results for Surface Water at SWMU 62, New Housing Fuel Leak

Location	Year	DRO (µg/L)	GRO (µg/L)	Indeno(1,2,3-cd)pyrene (µg/L)	TAH <sup>1</sup> (µg/L)	TAqH <sup>2</sup> (µg/L)

Endpoint Criteria <sup>1</sup>		90.6	12.2	None	None	None	None	0.0202	0.225

Notes:

<sup>1</sup> Endpoint criteria for East Canal have not been established so endpoints for South Sweeper Creek were used.

**Bold** indicates reported concentration is greater than endpoint criteria.

### 21.3 MONITORED NATURAL ATTENUATION

NAPs were collected at this site in 2009 to determine whether natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data indicated that biodegradation of petroleum hydrocarbons is likely occurring by iron (II) reduction; sulfate reduction; and methanogenesis as shown by elevated ferric iron concentrations, depleted sulfates, and elevated methane concentrations in comparison to background conditions. Groundwater parameters presented in Table 21-1, which were collected during the 2012 LTM event support the evidence of continued natural attenuation as shown by the reducing environment (negative ORP) and dissolved oxygen concentrations frequently depleted within contaminant plumes (less than 2.0 mg/L). A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

### 21.4 TREND EVALUATION

Statistical trend evaluations were conducted for target analyte concentrations in groundwater in accordance with the CMP, Revision 5 (Navy 2012e). Trend evaluation is conducted for only analytes that exceeded the endpoint criteria within the last two sampling events and had a

minimum of four data points. Results of Mann-Kendall and Sen's trend evaluations are summarized in Table 21-6. Worksheets and graphs are provided in Appendix H.

The following are the results of the statistical evaluation:

**Sandy Cove Housing Wells:**

- Wells 03-104, 03-778, MW-107-1, MW-134-11, and MW-146-1: DRO exhibits no trend at either the 80 or 95 percent confidence interval. The coefficient of variation indicates a stable concentration.
- Well 03-155: DRO exhibits an increasing trend at the 80 percent confidence interval. No trend is exhibited at the 95 percent confidence interval.
- Well MRP-MW2: DRO, GRO, and benzene all exhibit no trend at either the 80 or 95 percent confidence interval. The coefficients of variation indicate stable concentrations.
- Well MRP-MW3: DRO, GRO, benzene, ethylbenzene, and total xylenes exhibit no trend at either the 80 or 95 percent confidence intervals. The coefficients of variation indicate stable concentrations.
- Well MW-187-1: DRO is decreasing at the 80 percent confidence interval, however the Sen's evaluation of the trend is not statistically significant.

**Eagle Bay Housing Wells:**

- Well 03-502: The GRO concentration exhibits a decreasing trend at the 80 and 95 percent confidence intervals. Sen's evaluation indicates a statistically significant decreasing trend, with a median slope of -1,000.
- Wells AMW-704, RW-303-13, and RW-303-16: DRO exhibits no trend at either the 80 or 95 percent confidence interval. The coefficients of variation indicate stable concentrations.

**21.5 CONCLUSIONS**

This section presents the conclusions based on a review of groundwater monitoring conducted at the SWMU 62, New Housing Fuel Leak site in 2012. The conclusions are as follows:

- Groundwater Flow: The water level data indicate that the direction of groundwater flow in the main aquifer beneath the site is to the west-southwest beneath Sandy Cove and to the west-northwest beneath Eagle Bay, toward East Canal.

**Table 21-6. Concentration Trend Evaluation for SWMU 62, New Housing Fuel Leak**

Notes:

<sup>1</sup> Endpoint criteria are established from risk-based cleanup levels.

<sup>2</sup> Concentration stability is determined from the coefficient of variation when no trend exists at the 80% confidence interval (C.I.).

Sen's Slope is calculated for target analytes with decreasing concentration trends only.

- MNA: The groundwater parameters obtained during the 2012 LTM event provide evidence that natural attenuation of petroleum hydrocarbons continues to occur at the site.
- No free product was observed in any well during 2012 LTM activities.
- **Sandy Cove Housing 102, 107, and 146 Areas:** Three areas of contamination that exceeded endpoint criteria persist in the Sandy Cove Housing Area in 2012: an area of diesel contamination on the southern side of the residential area encompassing wells 03-155, MW-134-11, and MW-187-1; an area of diesel contamination on the north-central portion of the residential area west of the General Store encompassing wells MW-146-1 and MW-107-1; and an area of diesel and gasoline constituents west of Main Road, upgradient of the airport terminal, encompassing wells MRP-MW-2, MRP-MW3, 03-104, and 03-778 (Figure 21-1). All areas of contamination appear to have not changed in size since 2011. Conclusions for individual wells that are monitored are presented below:
  - Well 03-104: DRO has been detected above the endpoint criteria since 2007, and the trend analysis shows the DRO concentration is stable. Free product has not been observed in this well since 2006 (Appendix D-2). GRO and BTEX have remained below endpoint criteria for six sampling events. This well is located in the western-most plume
  - Well 03-155: DRO was detected above the endpoint criteria in 2012 for the sixth consecutive sampling event and shows an increasing trend in concentration at the 80 percent confidence interval. This well is located in the southern-most plume.
  - Well 03-619: DRO has remained below the endpoint criteria for six sampling events. This well is downgradient of the southern diesel contaminant plume.
  - Well 03-778: DRO was detected above the endpoint criteria in 2012. Statistical analysis shows the concentration is stable. GRO and BTEX have remained below endpoint criteria for seven sampling events. This well is located on the northern upgradient edge of the western-most plume.
  - Well 03-802: DRO has not been detected above the endpoint criteria for the last seven sampling events. This well is located downgradient of the central diesel plume and upgradient of the western diesel and gasoline plume.
  - Well 03-895: None of the analytes were detected above the endpoint criteria in the last seven sampling events (2006 through 2012). This well is downgradient of the western diesel and gasoline plume and shows that the contamination plume has not migrated to this location.

- Well HMW-146-3: DRO has remained below the endpoint criteria since 2010 (two consecutive sampling events). This well is located cross-gradient to the central diesel plume.
- Well MRP-MW2: Concentrations of GRO and benzene exceeded endpoint criteria in this well in 2012 for the fourth consecutive sampling event. Statistical analysis shows that concentrations of both contaminants are stable. DRO was detected below the endpoint criteria and statistical analysis shows that the concentration is stable. TEX compounds have not exceeded endpoint criteria since 2006 (six consecutive sampling events). This well is located within the western diesel and gasoline plume.
- Well MRP-MW3: Concentrations of DRO, GRO, ethylbenzene, and total xylenes exceeded endpoint criteria in this well in 2012. Benzene and toluene were below the endpoint criteria. Statistical analysis shows that the concentrations of all compounds in this well are stable. This well is located in a localized shallow perched aquifer within the western diesel and gasoline plume.
- Well MW-107-1: DRO has been detected above the endpoint criteria from 2006 through 2012 and exhibits a stable concentration at the 95 percent confidence interval. This well is located within the central diesel contaminant plume.
- Well MW-134-11: DRO has been detected above the endpoint criteria in this well from 2005 through 2012. This well exhibits a stable concentration at the 95 percent confidence interval. This well is located within the southern-most contaminant plume.
- Well MW146-1: DRO has been detected above the endpoint criteria since 2007 and exhibits a stable concentration at the 80 and 95 percent confidence intervals. This well is located within the central diesel contaminant plume.
- Well MW187-1: DRO has been detected above the endpoint criteria since 2006 and exhibits a statistically stable concentration. Benzene has been detected below endpoint criteria since 2010 (three consecutive sampling events). This well is located in the southern diesel contaminant plume.
- **Eagle Bay Housing:** Two main areas of groundwater contamination were observed at the Eagle Bay Housing Area in 2012. These areas were determined from 2012 LTM results and free product recovery activities performed between October 2011 and September 2012 (Appendix L). One area is associated with the East Canal shoreline petroleum seep that is located downgradient of the product recovery trench.

The area is located on the northwestern portion of the site encompassing the monitoring locations (counter-clockwise on Figure 21-2) 03-502, 03-101, CTO124-MW15, 03-102, RW-303-13, AMW-704, NL-09, HMW-303-09, RW-303-15, and HMW-303-11. This groundwater contamination plume contains both dissolved-phase diesel and gasoline components and floating free product and remains mostly unchanged from 2011 observations.

The second area is located on the southeastern portion of the site crossing Main Road and encompasses wells MW-303-07, MW-303-12, RW-303-4, HMW-303-03, and RW-303-16. This plume consists of floating free product and dissolved-phase diesel-range organics. This plume appears to not have changed in area compared to 2011 observations. Conclusions for individual wells that are monitored are presented below:

- Well 03-103: DRO has remained below the endpoint criteria since 2007 (six consecutive sampling events). This well is cross-gradient to the southern edge of the northwestern contaminant plume.
- Well 03-109: DRO has remained below the endpoint criteria since 2007 (seven consecutive sampling events). This well is cross-gradient to the southern edge of the plume.
- Well 03-502: GRO concentrations exceeded the endpoint criteria for the seventh consecutive sampling event. GRO exhibits a statistically significant decreasing concentration at the 80 and 95 percent confidence intervals. BTEX has remained below endpoint criteria for six consecutive sampling events. DRO remained below the endpoint criteria for the fourth time since 2006. This well is located cross-gradient to the northern edge of the northwestern diesel and gasoline plume.
- Well 03-898: DRO has remained below the endpoint criteria since 2006 (seven consecutive sampling events). This well is south of the recovery trench and cross-gradient to the northwestern plume.
- Well AMW-704: The DRO concentration dropped below endpoint criteria in 2012 and exhibits a stable concentration at the 80 and 95 percent confidence intervals. This well is downgradient and adjacent to East Canal and is located within the northwestern source plume.

- Well MW-303-7: This well was added to the monitoring program in 2011. DRO was again detected above the endpoint criteria in 2012. This well is east of the Main Road in the southeastern plume area.
- Well RW-303-13: DRO was detected below the endpoint criteria for the first time since 2010 and it exhibits a stable concentration at the 80 and 95 percent confidence intervals. This well is located upgradient and adjacent to the free product recovery trench and within the northwestern plume.
- Well RW-303-14: DRO has remained below the endpoint criteria since 2006 (seven consecutive sampling events). This well is located upgradient of the recovery trench and cross-gradient north of the northwestern contaminant plume.
- Well RW-303-16: The DRO concentration has remained above the endpoint criteria for the last seven sampling events and it exhibits a stable concentration at the 80 and 95 percent confidence intervals. This well is located on the south side of the site within the southeastern plume.
- A shoreline inspection of East Canal again observed the presence of a petroleum seep with extensive petroleum contamination located downgradient of the free product recovery trench where adsorbent booms are maintained to control sheen. Oily and iron-stained sediments, pooled oil, stressed vegetation, surface water sheen, and petroleum odor were observed along approximately 120 feet of the shoreline during the inspection.
- A surface water and sediment sample (NL-09) was collected downgradient of the maintained boom at this seep to determine the effectiveness of the boom in preventing migration of sheen downstream. The surface water sample exceeded criteria for GRO, TAH, and TAqH. The sediment sample did not exceed any endpoint criteria.

## **21.6 RECOMMENDATIONS**

### **Sandy Cove Housing Area**

The areas of groundwater contamination in Sandy Cove Housing appeared to be stable or somewhat diminishing in size. This is confirmed by stable or decreasing contaminant concentrations trends in 13 of the 14 wells analyzed. Wells 03-104 and 03-778 have had GRO and BTEX concentrations below endpoint criteria for at least six years. Well MW-187-1 has shown benzene concentrations below endpoint criteria for three consecutive sampling periods. Based on these observations, it is recommended that GRO and BTEX sampling be discontinued in wells 03-104 and 03-778 and that benzene sampling be discontinued in well 187-1. However, sampling for DRO in these wells should continue.

Well 03-895, which is located downgradient of the western gasoline-diesel plume, has exhibited DRO, GRO, and BTEX concentrations below endpoint criteria for seven consecutive sampling periods. All the wells within the western plume exhibit contaminant concentrations that are stable. Based on these results, it is recommended that monitoring at well 03-885 be discontinued.

Wells 03-802, HMW-102-1, and HMW-146-3 are located outside of the plume areas. Because contaminant concentrations are stable across the site and because these wells are located upgradient, cross-gradient, or far enough downgradient of the plumes, it is recommended that monitoring at these locations be discontinued.

Finally, because of the stable contaminant concentrations at this site, it is recommended that all other monitoring at Sandy Cove Housing Area be reduced to every odd year with the next monitoring to occur in 2013. This is consistent with the CMP, Revision 5 (Navy 2012e) to align all biennial sampling to odd year sampling.

### **Eagle Bay Housing Area**

Areas of groundwater contamination at Eagle Bay Housing Area appear to be stable or somewhat decreasing in concentrations. The area encompassed by the northwestern plume remained mostly unchanged from last year but no longer encompasses well 03-518. The southeastern diesel plume appears also appears to remain unchanged compared to 2011. Additionally, gasoline constituents have shown statistically significant decreasing concentrations in this plume, and DRO concentrations have remained stable across the site.

DRO concentrations in wells 03-103, 03-109, 03-898, and RW-303-14 have remained below endpoint criteria for at least six consecutive sampling events. These wells are located outside of the plume areas. Because of this and because DRO concentrations are stable in groundwater, it is recommended that sampling at these location be discontinued, but that monitoring for free product continue.

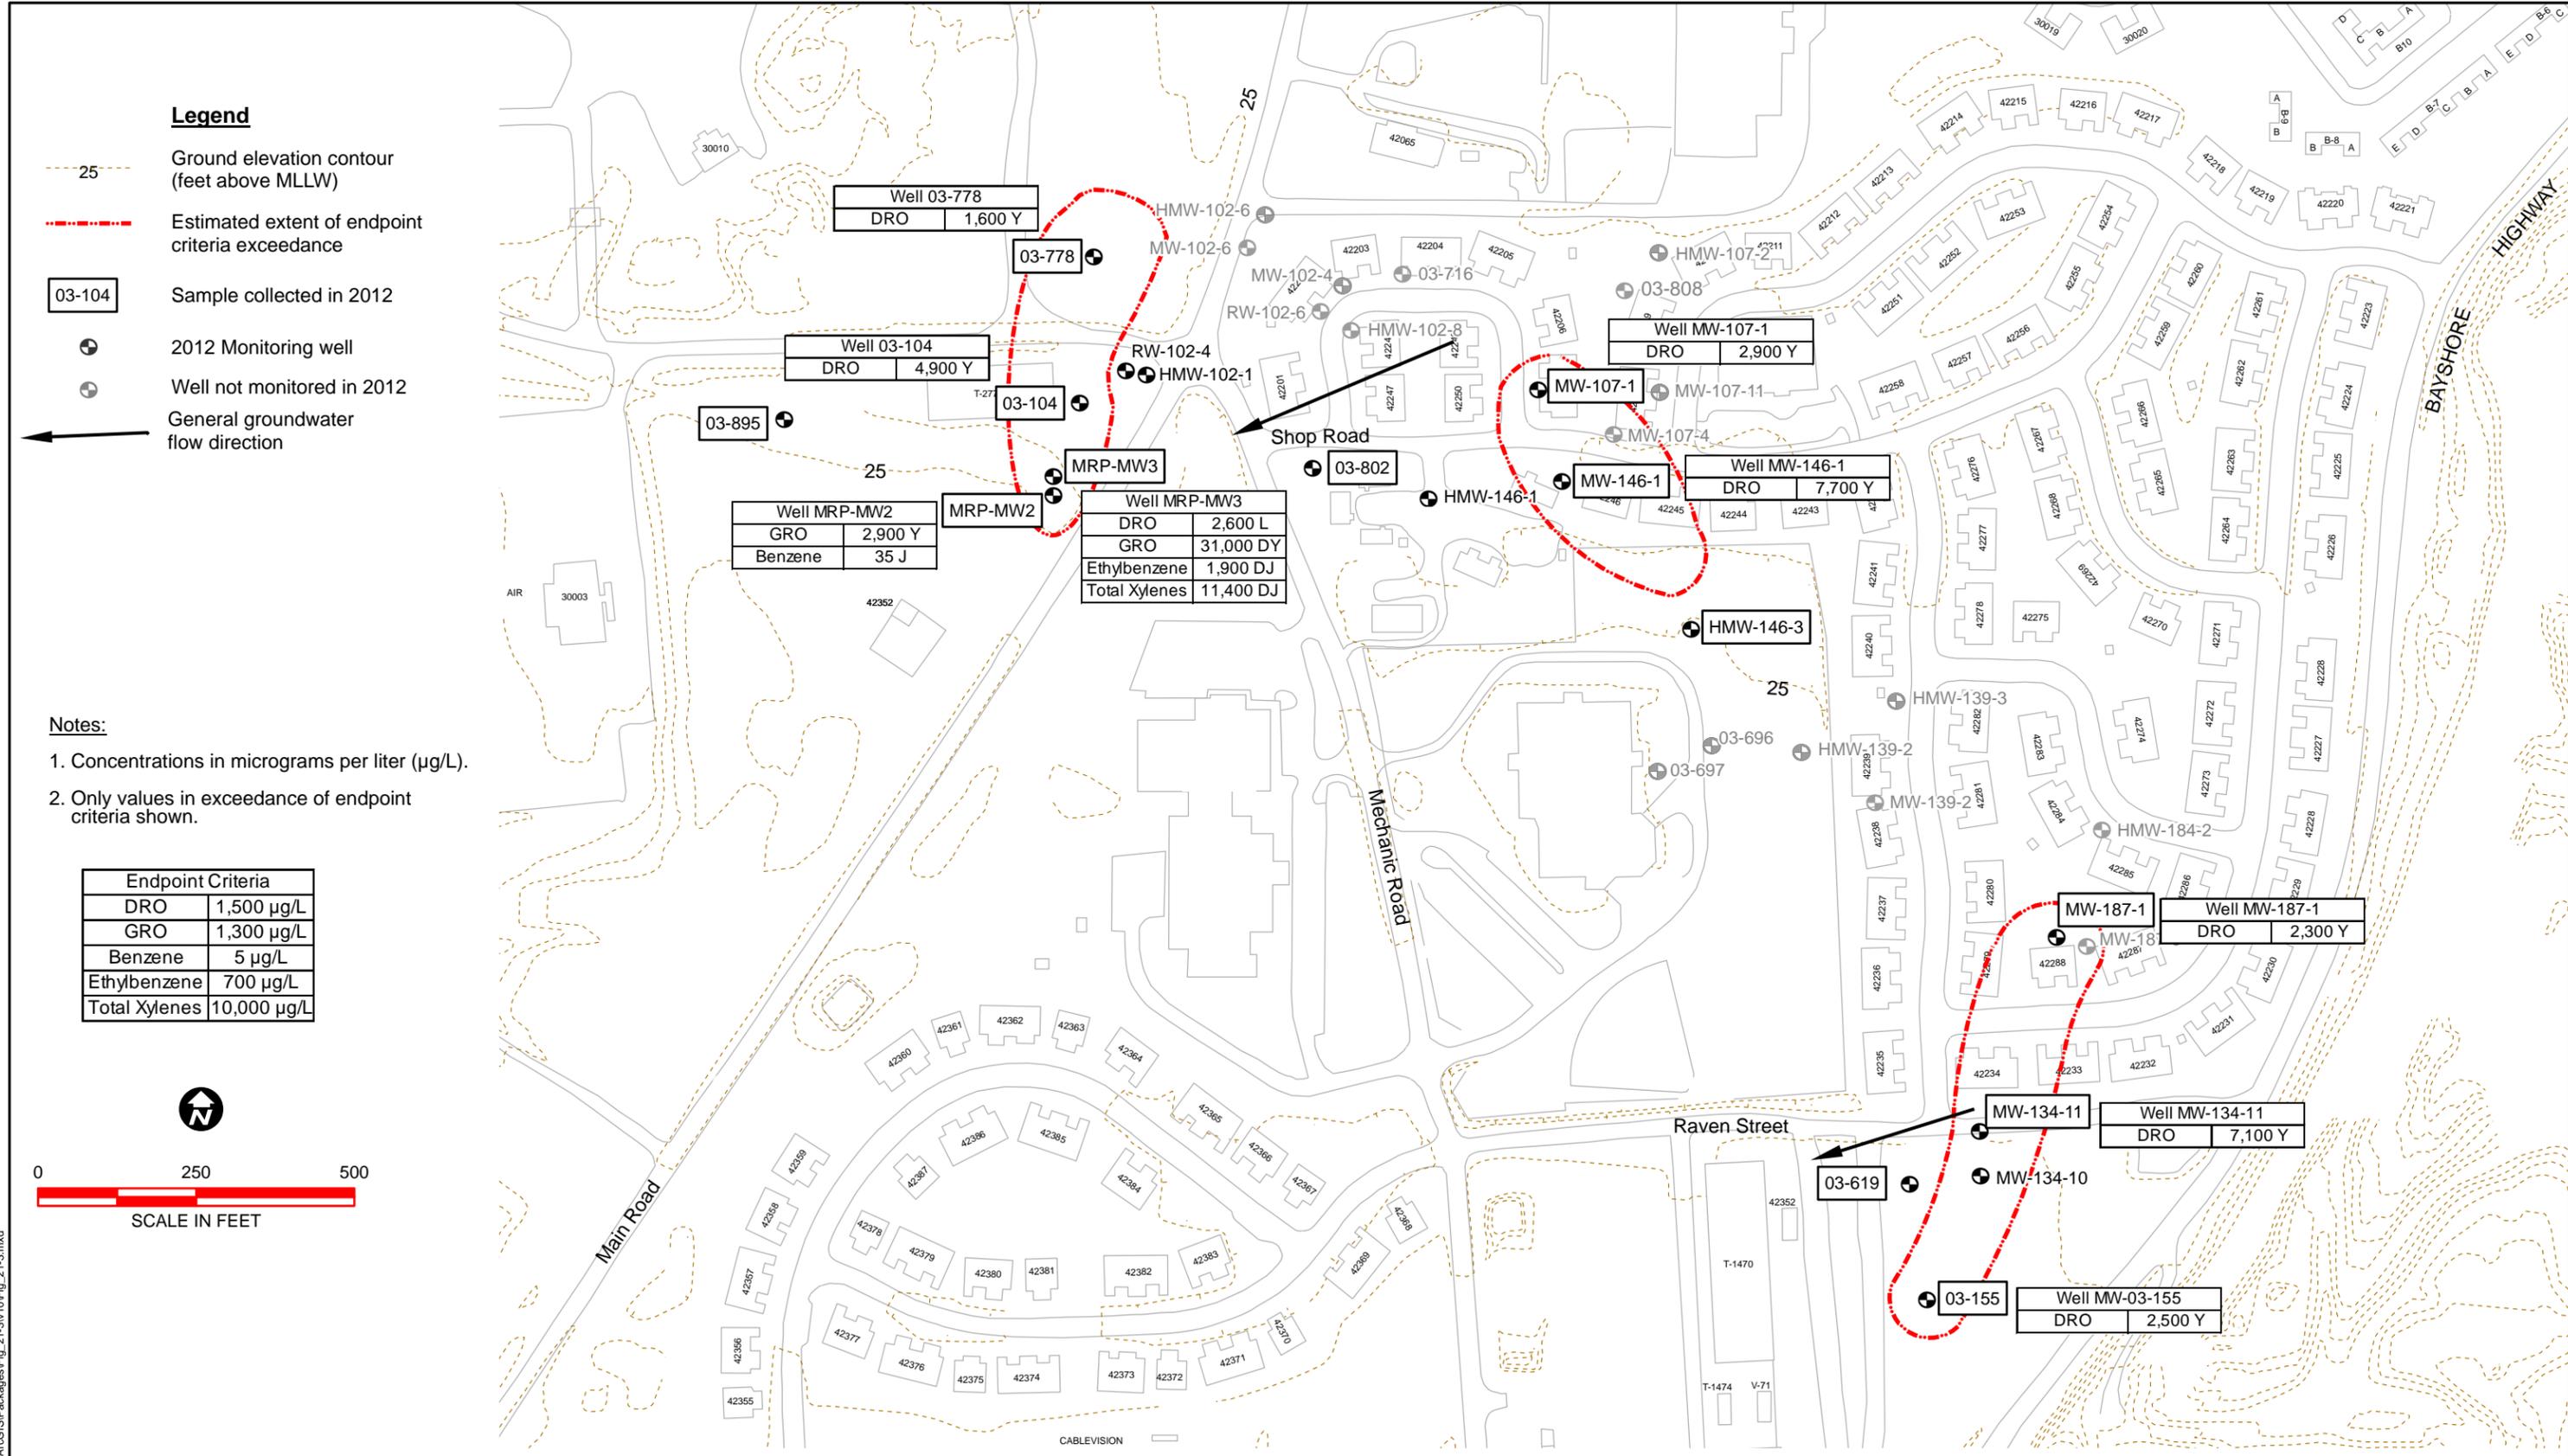

Additionally, DRO and BTEX have not been detected above endpoint criteria in well 03-502 since 2008 (four consecutive sampling events). It is therefore recommended that sampling for these compounds be discontinued in this well.

Several wells monitored for free product are located upgradient or cross-gradient of the two plumes which include wells (from north to south) 03-107, 03-518, RW-303-12, HMW-303-1, HMW-303-9, CTO124-MW14, RW-303-9, HMW-303-2, HMW-303-10, RW-303-7, RW-303-06, and MW-303-14 . Periodic free product recovery was performed at

wells 03-518, HMW-303-3, HMW-303-09, and RW-303-7 from October 2011 to September 2012 but no measurable free product was observed in these wells during this period. Monthly free product recovery has occurred at the other wells in past years but was discontinued due to the lack of observed free product in the wells. Because of this and the stable and decreasing concentrations of contaminants at the site, it is recommended that monitoring be discontinued at these wells.

Because natural attenuation is progressing at this site and because past monitoring have shown incremental changes to the site, it is recommended that all monitoring at this site be reduced to every odd year with the next monitoring to occur in 2013.

Because of the continued exceedance of groundwater criteria and because of the large petroleum shoreline seep in East Canal downgradient from the site, the Navy may conduct an additional remedial alternative analysis at SWMU 62 in the future.

## **22. TANKER SHED, UST 42494**

This section presents the results of groundwater monitoring performed at the Tanker Shed, UST 42494 site during 2012. The remedy specified for this site in the OU A ROD is free product recovery (Navy et al. 2000). The Navy and ADEC have selected free product recovery and MNA with ICs as the post-free product recovery remedy for this site (Navy and ADEC 2005). To comply with requirements specified for this remedy, the Navy conducts annual groundwater sampling and water level/product thickness monitoring at the site. Groundwater samples are collected from the wells to evaluate groundwater quality relative to Alaska groundwater cleanup levels (18 AAC 75.345), to verify that natural attenuation is occurring, and to monitor for surface water protection.

The following sections present field and laboratory data resulting from monitoring activities conducted at this site, a discussion of natural attenuation conditions, a comparison of target analyte concentration data to endpoint criteria specified in Section 3, trend evaluation analyses for historical target analyte concentration data, conclusions based on these analyses, and recommendations for future monitoring activities at the site.

### **22.1 FIELD MEASUREMENTS**

Depth-to-water and product thickness measurements were collected at 21 monitoring wells on August 31, 2012. Table 22-1 provides the measured depths to water (corrected for product thickness, if present), the calculated groundwater elevations, and if present the product thicknesses. Groundwater elevations have been corrected for the presence of free product in those wells with detectable thicknesses (Appendix D). Figure 22-1 shows the locations of the wells relative to the potential source areas, site topography, and interpreted groundwater flow direction which is to the west-southwest, toward East Canal.

Four groundwater samples were collected on September 7, 2012. One of these wells (04-601) is a surface water protection monitoring well. Field measurements were recorded on the field forms and logbooks during monitoring well sampling activities (Appendix A). Table 22-1 lists the final field measurements recorded at each monitoring well prior to sample collection. A review of the sampling data reported for this site indicates that prior to sample collection the groundwater parameters at all wells (except at well 04-601) stabilized to within specified criteria.

*Notes:*

- <sup>1</sup> Corrected for presence of product in the well.
- The reported casing elevation is the surveyed elevation residing in the NIRIS database.
- The last groundwater parameter measurement prior to sample collection is reported.

22-2

The required three casing volumes were removed from well 04-601 prior to sampling per the CMP Revision 5 (Navy 2012e). The 2012 analytical results in this well are consistent with past analytical results and appear to be unaffected by the lack of stabilization. Trace levels of free product was detected in one well, 04-301, during the 2012 annual LTM field event.

## **22.2 TARGET ANALYTE RESULTS**

The groundwater samples collected from wells 04-290, 04-306, and 04-601 were analyzed for DRO and GRO. Samples collected from well 04-175 was analyzed for DRO only. Table 22-2 presents the analytical results. Figure 22-1 presents the locations of the wells sampled and the analytical results that exceeded endpoint criteria. Historical analytical results obtained for these locations are summarized in Appendix C. Laboratory reports presenting the 2012 results are provided in Appendix F.

Groundwater collected from wells 04-175 (5,500  $\mu\text{g/L}$ ), 04-290 (5,600  $\mu\text{g/L}$ ), and 04-306 (4,700  $\mu\text{g/L}$ ) contained DRO exceeding the endpoint criteria of 1,500  $\mu\text{g/L}$ . DRO in downgradient well 04-601 was below the endpoint criteria. Groundwater collected from wells 04-290, 04-306, and 04-601 was below endpoint criteria for GRO (1,300  $\mu\text{g/L}$ ).

## **22.3 MONITORED NATURAL ATTENUATION**

NAPs were collected at this site in 2009 to determine whether natural attenuation was occurring in groundwater and to support the 5-year review process. The 2009 data indicated that biodegradation of petroleum hydrocarbons is occurring by iron (II) reduction; sulfate reduction; and methanogenesis as shown by elevated ferric iron concentrations, depleted sulfates, and elevated methane concentrations in comparison to background conditions. Groundwater parameters presented in Table 22-1, which were collected during the 2012 LTM event support evidence of continued natural attenuation as shown by the reducing environment (negative ORP) and depleted dissolved oxygen concentrations (0.0 mg/L) within the plume at the site. A more in-depth discussion of natural attenuation is presented in Section 4.1.2.

## **22.4 TREND EVALUATION**

Statistical trend evaluations were conducted for target analyte concentrations in groundwater in accordance with the CMP, Revision 5 (Navy 2012e). Trend evaluation is conducted for only analytes that exceeded the endpoint criteria within the last two sampling events and had a minimum of four data points. Results of the trend evaluations are summarized in Table 22-3. Worksheets and graphs are provided in Appendix H.

	2012	280 Y	100 U
Endpoint Criteria		1,500	1,300

Note:

**Bold** indicates reported concentration is greater than the endpoint criteria.

The following are the results of the statistical evaluation:

- Well 04-175: The DRO concentration exhibits a decreasing trend at the 80 percent confidence interval and no trend at the 95 percent confidence interval for data from 2005 through 2012. Sen's evaluation indicates the trend is statistically significant with a median slope of -248.
- Well 04-290: DRO exhibits an increasing trend at the 80 percent confidence interval for data from 2005 through 2012.
- Well 04-306: DRO exhibits no trend at the 80 or 95 percent confidence intervals. The coefficient of variation indicates that the concentration is stable.

## 22.5 CONCLUSIONS

This section presents conclusions based on a review of groundwater monitoring conducted at the Tanker Shed, UST 49424 site in 2012. The conclusions are as follows:

- Groundwater Flow: Based on the water levels measured in 2012, the interpreted groundwater flow direction at the site is to the west, toward East Canal.
- MNA: The groundwater parameters obtained during the 2012 LTM event showed evidence that natural attenuation of petroleum hydrocarbons continues to occur at the site.
- One well (04-301) was observed to have free product at trace levels.
- Well 04-175: DRO has been detected at a concentration above the endpoint criteria every year sampled since sampling started in 2001. The DRO concentration shows a statistically significant decreasing trend at the 80 and 95 percent confidence intervals. Well 04-175 represents the upgradient, eastern edge of the contaminant plume.
- Well 04-290: DRO has been detected above the endpoint criteria every year sampled since 2001, except for 2007. The DRO shows an increasing trend at the 80 percent confidence interval but the concentration is stable at the 95 percent confidence interval. GRO has remained below the endpoint criteria since 2005 (eight consecutive sampling events). This well represents the downgradient edge of the plume.
- Well 04-306: DRO remained above the endpoint criteria in 2012. GRO was detected at a concentration below the endpoint criteria for the second consecutive sampling event. DRO exhibits statistically stable concentrations at the 80 and 95 percent confidence intervals. This well is located within the center of the contaminant plume.

- Well 04-601: DRO and GRO have remained below endpoint criteria since at least 2006 (seven consecutive sampling events). This well is located downgradient of the plume.

## **22.6 RECOMMENDATIONS**

Concentrations of GRO have remained below endpoint criteria in all samples collected from site wells for at least two consecutive sampling events. Therefore, it is recommended that sampling for GRO be discontinued at the site (wells 04-290, 04-306, and 04-601).

Free product have not been observed at the following 13 onsite wells at a minimum of four sampling events (since 2008): 04-176, 04-178, 04-290, 04-303, 04-304, 04-307, 04-308, 04-309, 04-310, 04-311, 04-314, 04-317, and TS-04. Because of this, it is recommended that monitoring at these locations be discontinued.

- Because natural attenuation is progressing at this site and because past monitoring has shown incremental changes to the site, it is recommended that all monitoring at this site be reduced to every odd year with the next monitoring to occur in 2013.

**Table 22-3.** Concentration Trend Evaluation for Tanker Shed, UST 42494

Well	Target Analyte	Exceeds Endpoint Criteria	Highest Concentration Last Two Sampling Periods (µg/L)	Endpoint Criteria <sup>1</sup> (µg/L)	Sampling Periods (n)	Mann-Kendall Statistic (S)	Mann-Kendall Trend			Sen's Slope			
							Trend at 80% C.I.	Trend at 95% C.I.	Concentration Stability <sup>2</sup>	Median Slope	Statistically Significant Trend	2-Tailed Test at 80% C.I.	
											Lower Limit	Upper Limit	
04-175	DRO	Yes	5,600 Y	1,500	8	-14	Decreasing	No trend	NA	-248	Yes	-917	-167
04-290	DRO	Yes	5,900 Y	1,500	8	9	Increasing	No trend	NA	NC	NC	NC	NC
04-306	DRO	Yes	7,200 Y	1,500	6	5	No trend	No trend	Stable	NC	NC	NC	NC

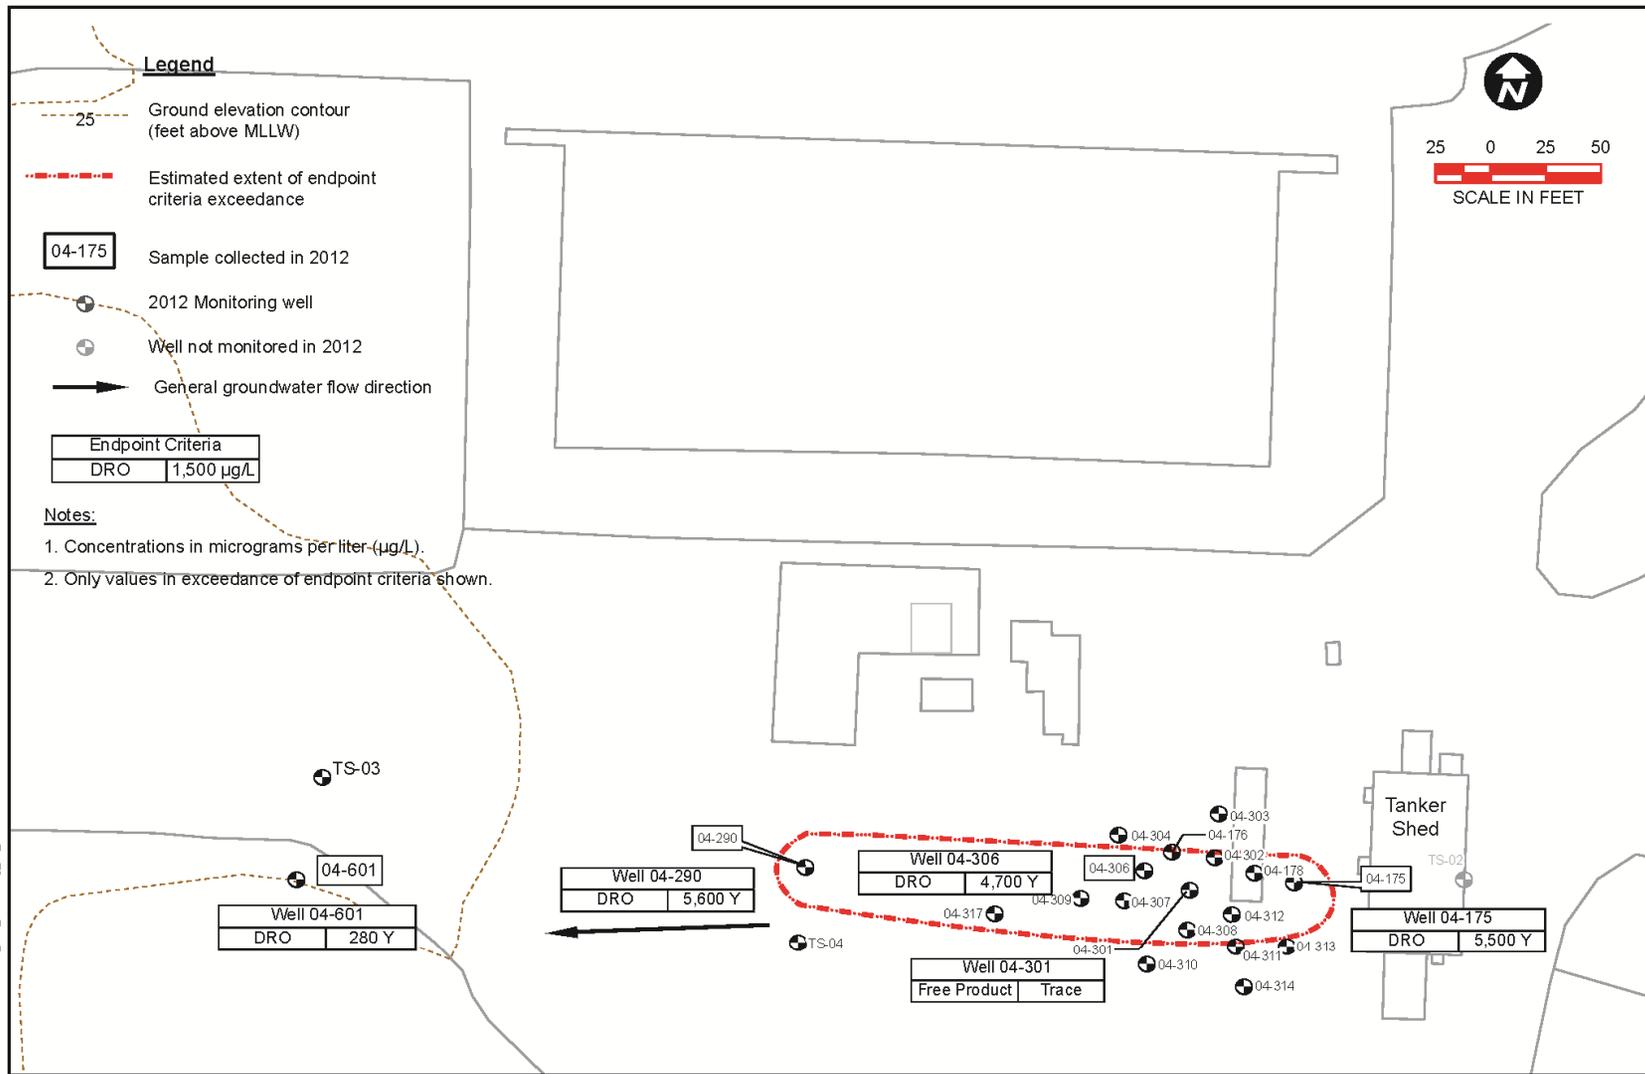

Notes:

<sup>1</sup> Endpoint criteria are established from risk-based cleanup levels.

<sup>2</sup> Concentration stability is determined from the coefficient of variation when no trend exists at the 80% confidence interval (C.I.).

Sen's Slope is calculated for target analytes with decreasing concentration trends only.

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: Former Power Plant      Sample Location: 01-150  
 Inspector(s): B.G. Les / D. Balmer      Date/Time: 9/1/12 1345  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: Cloudy, windy rain, cold (~50°F) @

### Well Data

Diameter of Well Casing: 1 1/2 in.  
 Depth to Water Below Top of Casing (feet): 20.04'  
 Total Depth of Well Below Top of Casing (feet): 27.05' (2011) (12012)  
 Purge Method: Low flow peristaltic      Intake at 23.5' ft  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 7.01  
 Gallons per Foot: 0.10 g      Gallons in Well: 0.70  
 Three Times Casing Volume: 2.1 g      Gallons Purged from Well: 2.0

### Water Sample Data

Sample Number: 01-150-2012  
 Time Sample Collected: 1435  
 Sampling Method: Low flow peristaltic  
 Remarks (Color/Odor): None  
 Stabilized? Yes      3 Casing Volumes Removed? NA

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/l.)	Temp (C)	Salinity (‰)	Redox (mv)
INITIAL	1413	6.06	0.605	11.5	0.33	7.52	0.0	26
.5	1418	6.12	0.514	15.2	0.72	6.94	0.0	5
1.0	1423	6.14	0.499	29.1	0.00	7.01	0.0	4
1.5	1428	6.12	0.487	29.2	0.00	7.02	0.0	5
2.0	1433	6.12	0.484	28.7	0.00	6.95	0.0	4

### TEST KIT RESULTS

DO (ppm)	Fe <sup>2+</sup> (ppm)	CO <sub>2</sub> (ppm)
NA	NA	NA

Notes: \_\_\_\_\_  
 \_\_\_\_\_  
 \_\_\_\_\_

### Well Casing Volumes

GAL/FOOT 3/4" = 0.02    1-1/4" = 0.077    2" = 0.16    3" = 0.37    4" = 0.65  
 1-1/2" = 0.10    2-1/2" = 0.24    3-1/2" = 0.50    6" = 1.46

| 16. Previous well depth: _____ Current well depth: _____   |                          |   |
| 17. Depth to water: _____  |                          |   |
| 18. PID reading at wellhead: _____ Breathing Zone: _____   |                          |   |

Additional notes: \*Well not located. New well in location where 01-151 should be. Do not sample new well, as per A. Vernik (Navy RPM)

Vslw

**Seep and Shoreline  
Visual Inspection Checklist**

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: Former Power Plant Well No.: East Canal  
 Inspector(s): A. Lewis, R. Bayel Date/Time: 9/1/12 1510  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 51°F, overcast, moderate wind

1. Was a contaminated seep located? If yes, describe the seep (including length and width) and flow rate. Yes No

Evidence of possible seeps located at boom locations 9/12, 511. See photos 9/1/12 9/12/12

2. Is the seep flowing directly into a surface water body?    
 3. Is this a new seep or a seep that has been previously documented? Previously documented  
 4. Are there any odors? If yes, describe odor and intensity

Moderate petroleum odor near boom 11, light petroleum odor near booms 9/12

5. Is there vegetation growing at the seep location?    
 6. Is the shoreline discolored by suspected contamination? If yes, describe appearance, location, and square footage

Petroleum stained rocks, sediment & vegetation along boom 11 (30ft x 4ft) See photos 9/12/12

Surface sneening along booms 9/12 (80ft x 2ft) See photos 9/12/12

7. Is there vegetation growing on the shoreline?    
 8. Is any suspect ordnance found on the shoreline? If yes, describe the location and approximate size and shape, and color without approaching ordnance. Note location on back of form. Secure area. Stop work! Notify Navy CSO immediately!

9. Was there any other manmade debris (exclude items from off-island activities) found on the shoreline? If yes, describe debris, whether it could be contributing to contamination, and provide number of pieces or square footage of area.

Submerged drum ~10ft center of East Canal water body adjacent to NL-08 (unable to see drum in photo 9/12/12 1034 due to glare)

Additional Notes: New ~75 ft of remediated shoreline upgradient from boom 9/12

See photos

**Sediment Sampling  
Visual Inspection Checklist**

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
Site Name: Former Power Plant Sample No.: NL-08S-2012 [1240]  
Inspector(s): A. Lewis, R. Boyd Date/Time: 9/1/12 1225  
Company: Sealaska Environmental Services, LLC  
Weather/Temperature: 51°F, overcast, rain, moderate wind

1. Describe sediment appearance (color, grain size, organic matter, etc.). Is contamination suspected? ...  Yes  No  
Dark grey/black, light brown at 1/8" surface, medium grain sand, no organic matter in sample or at sample location, light sheen observed at surface of sediment
2. Are there any odors? If yes, describe the odor and intensity and if it is suspected contamination .....  Yes  No

3. Is there manmade debris within 200 feet of the sampling location that could affect sample results? ....  Yes  No

Submerged drum ~ 10 ft center of East Canal water body adjacent to sample location (unable to see drum in photo 9/1/12 1039 due to glare)

4. Is there a petroleum sheen or color change on the surface water or sediment after it was disturbed? ....  Yes  No  
Light Sheening after sediment was disturbed.

5. Is there vegetation growing in the sediment or nearby? .....  Yes  No  
6. Are there any insects, invertebrates, or fish in or on the sediment or evidence of wildlife nearby? .....  Yes  No  
Green wing teal, eagle, raven

## Surface Water Sampling Visual Inspection Checklist

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: Former Power Plant Sample No.: NL-08-2012 [1300]  
 Inspector(s): A. Lewis, R Boyd Date/Time: 9/1/12 1255  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 51° F, overcast, moderate wind, rain

1. Is there any sheen or visible contamination on or in the water? <sup>Sheen seen at the water on shoreline and disturbing sediment</sup>   Yes No  
 2. Are there any odors (e.g., petroleum or sulfide/rotten egg)? If yes, describe the odor and intensity.....   Yes No

Faint petroleum odor

3. Is there manmade debris within 200 feet of the sampling location that could affect sample results? ....   Yes No

4. If so, describe: Submerged 55 gal drum 10 ft from sample location, as previously noted in 2011 photo of drum.

5. Is there discoloring along the banks of the water body that may be due to contamination? If yes, describe appearance, location, and square footage. ....   Yes No

Light iron colored sediment along the surface of banks, sediment black with light sheening

6. Describe the sample (clear, colored, muddy, odors, etc.):

Moderately clear, faint petroleum odor

7. Is there vegetation growing nearby? .....   Yes No

8. Are there signs of wildlife use nearby (birds, fish, etc.)? <sup>Greenwing teal, shorebirds, eagle, raven</sup>   Yes No

9. Estimate volume of flow or stream size (width and depth) if sample collected from a stream or seep: \_\_\_\_\_

40 ft wide, 16" deep

8. Is erosion occurring? If yes, describe conditions and severity.....   Yes No

9. Is deposition occurring in the water body? If yes, describe conditions .....   Yes No

Additional Notes: \_\_\_\_\_

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: GCI Compound      Sample Location: 04-100  
 Inspector(s): B Giles / D Balmer      Date/Time: 9/4/12 0945  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: Strong wind 35-50 mph, cloudy, rain ~50°F (50)

### Well Data

Diameter of Well Casing: 1 1/2 in.  
 Depth to Water Below Top of Casing (feet): 28.11'  
 Total Depth of Well Below Top of Casing (feet): 34.58'  
 Purge Method: low flow peristaltic      Intake at 31.0' to  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 6.47'  
 Gallons per Foot: 0.10g      Gallons in Well: 0.65g  
 Three Times Casing Volume: 1.94g      Gallons Purged from Well: 1.95

### Water Sample Data

Sample Number: 04-100-2012 and 04-110-2012 (Dup.)  
 Time Sample Collected: 1030      1040  
 Sampling Method: low flow peristaltic  
 Remarks (Color/Odor): None  
 Stabilized? Yes ~~No~~      3 Casing Volumes Removed? Yes  
SLW 9/4/12

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: GCI Compound      Sample Location: 04-210  
 Inspector(s): B.Giles/D Balmer      Date/Time: 9/4/12 1055  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: Strong wind 35-50 mph / cloudy, rainy ~ 50°F @ 12:00

### Well Data

Diameter of Well Casing: 2-in  
 Depth to Water Below Top of Casing (feet): 24.72' to  
 Total Depth of Well Below Top of Casing (feet): 32.91' to  
 Purge Method: Low flow peristaltic      Intake set at: 28.8' to  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 8.19'  
 Gallons per Foot: 0.16 g      Gallons in Well: 1.31 g  
 Three Times Casing Volume: 3.93      Gallons Purged from Well: 2.0 g

### Water Sample Data

Sample Number: 04-210-2012  
 Time Sample Collected: 1138  
 Sampling Method: Low flow peristaltic  
 Remarks (Color/Odor): None  
 Stabilized? yes      3 Casing Volumes Removed? NA

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (‰)	Redox (mv)

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: GCI Compound      Sample Location: 04-701  
 Inspector(s): B. Giles / D. Balmer      Date/Time: 9/3/12 1300  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: Heavy Rain / Wind 35-45 mph ~50° F (SW)

### Well Data

Diameter of Well Casing: 2 in.  
 Depth to Water Below Top of Casing (feet): 14.13' to  
 Total Depth of Well Below Top of Casing (feet): 21.39' to (in 2011), 21.31' to (in 2012) (SW)  
 Purge Method: Low flow peristaltic      Intake set at 17.5' to  
 Calculate if well parameters do not stabilize per the work plan: (using 2011 DTB)  
 Length of Water Column in Well (feet): 7.26'  
 Gallons per Foot: 0.16 g      Gallons in Well: 1.16  
 Three Times Casing Volume: 3.48 g      Gallons Purged from Well: 3.5 g

### Water Sample Data

Sample Number: 04-701-2012  
 Time Sample Collected: 1350  
 Sampling Method: Low flow peristaltic  
 Remarks (Color/Odor): None  
 Stabilized? No      3 Casing Volumes Removed? Yes

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
1.0	1320	5.99	0.208	19.3	1.71	6.84	0.0	73
1.5	1324	6.14	0.265	6.9	0.00	6.68	0.0	9
1.0	1328	6.28	0.285	5.7	0.00	6.63	0.0	-9
1.5	1332	6.33	0.290	9.0	0.00	6.66	0.0	-19
2.0	1336	6.35	0.293	17.8	0.00	6.61	0.0	-21
2.5	1340	6.38	0.296	20.8	0.00	6.56	0.0	-27
3.0	1344	6.38	0.300	29.2	0.00	6.54	0.0	-28
3.5	1348	6.39	0.297	32.5	0.00	6.58	0.0	-31

### TEST KIT RESULTS

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: NMBC      Sample Location: 02-453  
 Inspector(s): A. Lewis, R. Boyd      Date/Time: 8/29/12 1055  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 52°F, moderate wind, partial overcast

### Well Data

Diameter of Well Casing: 2"  
 Depth to Water Below Top of Casing (feet): 9.42  
 Total Depth of Well Below Top of Casing (feet): 15.08  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 5.66  
 Gallons per Foot: 0.16      Gallons in Well: 0.91  
 Three Times Casing Volume: 2.72      Gallons Purged from Well: 1.5

### Water Sample Data

Sample Number: 02-453-2012  
 Time Sample Collected: 1125  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): clear w/ht smell of petroleum  
 Stabilized? Yes      3 Casing Volumes Removed? No

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
initial	1109	6.51	3.21	13	1.15	9.02	0.0	-83
.5	1112	6.51	3.05	12	0.00	8.96	0.0	-87
1.0	1116	6.52	3.02	13	0.00	8.95	0.0	-89
1.5	1120	6.53	3.00	13	0.00	8.91	0.0	-93
<b>TEST KIT RESULTS</b>								
DO (ppm)		Fe <sup>2+</sup> (ppm)		CO <sub>2</sub> (ppm)				
N/A		N/A		N/A				

Notes: Breathing zone PID: 0.0 ppm

### Well Casing Volumes

GAL/FOOT    ¾" = 0.02    1-1/4" = 0.077    2" = 0.16    3" = 0.37    4" = 0.65  
                  1-1/2" = 0.10    2-1/2" = 0.24    3-1/2" = 0.50    6" = 1.46

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: NMBC Sample Location: E-201  
 Inspector(s): A. Lewis, R. Boyd Date/Time: 8/30/12 1000  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 51°F, overcast, light wind

### Well Data

Diameter of Well Casing: 2"  
 Depth to Water Below Top of Casing (feet): 13.47  
 Total Depth of Well Below Top of Casing (feet): 18.87  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 5.40  
 Gallons per Foot: 0.16 Gallons in Well: 0.86  
 Three Times Casing Volume: 2.59 Gallons Purged from Well: 3

### Water Sample Data

Sample Number: E-201-2012  
 Time Sample Collected: 1055  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): clear - light smell of petroleum  
 Stabilized? NO 3 Casing Volumes Removed? yes

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
Initial	1022	6.51	0.291	5	3.84	6.05	0.0	-64
.5	1026	6.37	0.287	7	2.51	5.97	0.0	-64
1.0	1030	6.33	0.286	8	2.31	5.96	0.0	-70
1.5	1034	6.33	0.290	11	2.20	6.02	0.0	-79
2.0	1038	6.36	0.292	14	2.14	6.03	0.0	-86
2.5	1042	6.38	0.296	17	2.05	6.03	0.0	-93
3.0	1046	6.41	0.298	15	1.94	6.06	0.0	-99
<b>TEST KIT RESULTS</b>								
DO (ppm)		Fe <sup>2+</sup> (ppm)		CO <sub>2</sub> (ppm)				
N/A		N/A		N/A				

Notes: Breathing zone PID: 0.0 ppm

Fine black particulate seen in flowcell throughout purge.

#### Well Casing Volumes

GAL/FOOT 3/4" = 0.02 1-1/4" = 0.077 2" = 0.16 3" = 0.37 4" = 0.65  
 1-1/2" = 0.10 2-1/2" = 0.24 3-1/2" = 0.50 6" = 1.46

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: NMBC      Sample Location: NMBC-04  
 Inspector(s): A. Lewis, R. Boyd      Date/Time: 8/29/12 1430  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 55°F, moderate wind, partial overcast

### Well Data

Diameter of Well Casing: 2"  
 Depth to Water Below Top of Casing (feet): 12.35  
 Total Depth of Well Below Top of Casing (feet): 18.48  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 6.13  
 Gallons per Foot: 0.16      Gallons in Well: 0.98  
 Three Times Casing Volume: 2.94      Gallons Purged from Well: 2.0

### Water Sample Data

Sample Number: NMBC-04-2012  
 Time Sample Collected: 1510  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): light smell of petroleum  
 Stabilized? yes      3 Casing Volumes Removed? NO

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (‰)	Redox (mv)
Initial	1444	6.43	0.283	21	2.21	7.88	0.0	-55
.5	1448	6.37	0.277	19	0.00	7.56	0.0	-56
1.0	1452	6.40	0.272	14	0.00	7.44	0.0	-63
1.5	1456	6.40	0.275	14	0.00	7.46	0.0	-65
2.0	1500	6.41	0.277	13	0.00	7.45	0.0	-66

### TEST KIT RESULTS

DO (ppm)	Fe <sup>2+</sup> (ppm)	CO <sub>2</sub> (ppm)
N/A	N/A	N/A

Notes: Breathing zone PID: 0.0 ppm

### Well Casing Volumes

GAL/FOOT    3/4" = 0.02    1-1/4" = 0.077    2" = 0.16    3" = 0.37    4" = 0.65  
                  1-1/2" = 0.10    2-1/2" = 0.24    3-1/2" = 0.50    6" = 1.46

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: NMCB      Sample Location: NMCB-11  
 Inspector(s): B.G. Les / D. Palmer      Date/Time: 8/29/12 1400  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: p. cloudy, mild, breezy      ~50°F

### Well Data

Diameter of Well Casing: 2-1/4"  
 Depth to Water Below Top of Casing (feet): 9.61'      Trace product  
 Total Depth of Well Below Top of Casing (feet): 18.77'  
 Purge Method: Low flow peristaltic      Intake at 14.4'  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 9.16  
 Gallons per Foot: 0.16 g      Gallons in Well: 1.47  
 Three Times Casing Volume: 4.4 g      Gallons Purged from Well: 3.0 g

### Water Sample Data

Sample Number: NMCB-11-2012      [w/ main #09 for select parameters] SW  
 Time Sample Collected: 1445  
 Sampling Method: Low flow peristaltic  
 Remarks (Color/Odor): None  
 Stabilized? yes      3 Casing Volumes Removed? NA

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (‰)	Redox (mv)

### Seep and Shoreline Visual Inspection Checklist

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: NMCB Well No.: LA  
 Inspector(s): B Giles / D Balmar Date/Time: 8/29/12 0745  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: cloudy, foggy, cool, breezy, ~ 50° F EW

1. Was a contaminated seep located? If yes, describe the seep (including length and width) and flow rate.....  Yes  No

2. Is the seep flowing directly into a surface water body? ..... NA  Yes  No  
 3. Is this a new seep or a seep that has been previously documented? ..... NA  Yes  No  
 4. Are there any odors? If yes, describe odor and intensity ..... NA  Yes  No

5. Is there vegetation growing at the seep location? ..... NA  Yes  No  
 6. Is the shoreline discolored by suspected contamination? If yes, describe appearance, location, and square footage.....  Yes  No

7. Is there vegetation growing on the shoreline? ..... scarcely in places  Yes  No  
 8. Is any suspect ordnance found on the shoreline? If yes, describe the location and approximate size and shape, and color without approaching ordnance. Note location on back of form. Secure area. Stop work! Notify Navy CSO immediately! .....  Yes  No

9. Was there any other manmade debris (exclude items from off-island activities) found on the shoreline? If yes, describe debris, whether it could be contributing to contamination, and provide number of pieces or square footage of area.....  Yes  No  
Scrap metal, wood, concrete pieces and rebar observed in places in rip rap, not a source of petroleum contamination.

Additional Notes: Two culvert pipes observed (18-in diam & 12-in diam) passing through rip rap, probably stormwater. Neither was flowing.

**Sediment Sampling  
Visual Inspection Checklist**

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
Site Name: NMCB Sample No.: NL-055-2012 (10:30)  
Inspector(s): John Highstone, Sherril Wunderlich Date/Time: 8/29/12 10:00  
Company: Sealaska Environmental Services, LLC  
Weather/Temperature: partly sunny, light wind, 50° F

1. Describe sediment appearance (color, grain size, organic matter, etc.). Is contamination suspected? ...  Yes  No  
Dark brown sediment - slightly silty, fine to coarse sand w/  
scattered fine gravel. Contains small pieces of shell & barnacles.
2. Are there any odors? If yes, describe the odor and intensity and if it is suspected contamination .....  Yes  No
3. Is there manmade debris within 200 feet of the sampling location that could affect sample results? ....  Yes  No
4. Is there a petroleum sheen or color change on the surface water or sediment after it was disturbed? ....  Yes  No
5. Is there vegetation growing in the sediment or nearby? ..... kelp is nearby  Yes  No
6. Are there any insects, invertebrates, or fish in or on the sediment or evidence of wildlife nearby? .....  Yes  No

Additional Notes: \_\_\_\_\_

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO55  
 Site Name: Runway 5-23 Sample Location: 14-100  
 Inspector(s): A. Lewis, R. Boyd Date/Time: 9/5/12 1350  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 52°F, overcast

### Well Data

Diameter of Well Casing: 2"  
 Depth to Water Below Top of Casing (feet): 2.56  
 Total Depth of Well Below Top of Casing (feet): 12.92 (2010) 12.92 (2012)  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 10.36 (2010 DTB used)  
 Gallons per Foot: 0.16 Gallons in Well: 1.66  
 Three Times Casing Volume: 4.97 Gallons Purged from Well: 1.5

### Water Sample Data

Sample Number: 14-100-2012  
 Time Sample Collected: 1415  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): clear, no odors  
 Stabilized? yes 3 Casing Volumes Removed? NO

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
initial	1400	6.41	0.485	19	0.51	9.37	0.0	-61
0.5	1404	6.40	0.481	19	0.00	9.02	0.0	-65
1.0	1408	6.40	0.482	18	0.00	8.99	0.0	-68

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO55  
 Site Name: Runway 5-23 Sample Location: 14-110  
 Inspector(s): A. Lewis, R. Boyd Date/Time: 9/5/12 1430  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 52° F, overcast

### Well Data

Diameter of Well Casing: 1.5"  
 Depth to Water Below Top of Casing (feet): 2.78  
 Total Depth of Well Below Top of Casing (feet): 11.36 (2010) 11.37 (2012)  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 8.58 (2010 DTB used)  
 Gallons per Foot: 0.10 Gallons in Well: 0.86  
 Three Times Casing Volume: 2.57 Gallons Purged from Well: 2.0

### Water Sample Data

Sample Number: 14-110-2012  
 Time Sample Collected: 1510  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): clear water, No odors  
 Stabilized? Yes 3 Casing Volumes Removed? NO

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
initial	1441	6.32	0.395	0	0.65	10.22	0.0	-50
.5	1445	6.29	0.451	0	0.00	10.20	0.0	-59
1.0	1449	6.29	0.468	0	0.00	10.17	0.0	-65
1.5	1453	6.30	0.473	0	0.00	10.15	0.0	-66
2.0	1457	6.30	0.474	1	0.00	10.16	0.0	-69

### TEST KIT RESULTS

DO (ppm)	Fe <sup>2+</sup> (ppm)	CO <sub>2</sub> (ppm)
N/A	N/A	N/A

Notes: Well surrounded by surface water. See photo.

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: SA 78      Sample Location: 12-802  
 Inspector(s): B Giles / D Bulmer      Date/Time: 8/31/12 15:10  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: Rain, wind, cold      ~50°F (slw)

### Well Data

Diameter of Well Casing: 2-in  
 Depth to Water Below Top of Casing (feet): 28.4'  
 Total Depth of Well Below Top of Casing (feet): 10.2' in 2010 (slw)  
 Purge Method: low flow peristaltic      Intake set at 7.5' to  
 Calculate if well parameters do not stabilize per the work plan: (using 2010 DTB) (slw)  
 Length of Water Column in Well (feet): 7.36'  
 Gallons per Foot: 0.16g      Gallons in Well: 1.18g  
 Three Times Casing Volume: 3.53g      Gallons Purged from Well: 3.0

### Water Sample Data

Sample Number: 12-802-2012  
 Time Sample Collected: 16:15  
 Sampling Method: low flow peristaltic  
 Remarks (Color/Odor): None  
 Stabilized? Yes      3 Casing Volumes Removed? NA

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)

### Seep and Shoreline Visual Inspection Checklist

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: SA 78 Old Transportation Bldg Well No.: 12-802  
 Inspector(s): B Gilas / D Badner Date/Time: 8/31/12 0905  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: Overcast, foggy, windy, cold ~50°F (30)

- |   | Yes                                 | No                                  |
|---|-------------------------------------|-------------------------------------|
| 1. Was a contaminated seep located? If yes, describe the seep (including length and width) and flow rate.....   | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| <hr/>   |                                     |                                     |
| 2. Is the seep flowing directly into a surface water body?..... <u>NA</u>   | <input type="checkbox"/>            | <input type="checkbox"/>            |
| 3. Is this a new seep or a seep that has been previously documented? <u>NA</u>  | <input type="checkbox"/>            | <input type="checkbox"/>            |
| 4. Are there any odors? If yes, describe odor and intensity..... <u>NA</u>  | <input type="checkbox"/>            | <input type="checkbox"/>            |
| <hr/>   |                                     |                                     |
| 5. Is there vegetation growing at the seep location?..... <u>NA</u>   | <input type="checkbox"/>            | <input type="checkbox"/>            |
| 6. Is the shoreline discolored by suspected contamination? If yes, describe appearance, location, and square footage.....   | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| <hr/>   |                                     |                                     |
| 7. Is there vegetation growing on the shoreline?..... <u>Grasses, some flowering plants</u>   | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| 8. Is any suspect ordnance found on the shoreline? If yes, describe the location and approximate size and shape, and color without approaching ordnance. Note location on back of form. Secure area. Stop work! Notify Navy CSO immediately!..... | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| <hr/>   |                                     |                                     |
| 9. Was there any other manmade debris (exclude items from off-island activities) found on the shoreline? If yes, describe debris, whether it could be contributing to contamination, and provide number of pieces or square footage of area.....  | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |

Occasional metal debris, not a source of petroleum contamination.

Additional Notes: No surface water/sediment sample collected. No evidence of petroleum contamination observed.

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: SA-79      Sample Location: 02-230  
 Inspector(s): A. Lewis, R. Boyd      Date/Time: 8/27/12 1045  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 50° F, overcast

### Well Data

Diameter of Well Casing: 2 inch  
 Depth to Water Below Top of Casing (feet): 12.48  
 Total Depth of Well Below Top of Casing (feet): 18.93  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 6.45  
 Gallons per Foot: 0.16      Gallons in Well: 1.03  
 Three Times Casing Volume: 3.10      Gallons Purged from Well: 2.5

### Water Sample Data

Sample Number: 02-230-2012  
 Time Sample Collected: 1010  
 Sampling Method: low-flow  
 Remarks (Color/Odor): None  
 Stabilized? yes      3 Casing Volumes Removed? NO

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
initial	0947	6.11	0.701	11	1.34	7.31	0.0	-60

**Seep and Shoreline  
Visual Inspection Checklist**

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: SA 79, Main Rural Pipeline Well No.: NA  
 Inspector(s): B Giles / D Balmer Date/Time: 8/29/12 0745  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: cloudy, mild, occas. drizzle ~50°F

1. Was a contaminated seep located? If yes, describe the seep (including length and width) and flow rate. Yes No  
 .....

2. Is the seep flowing directly into a surface water body? ..... NA    
 3. Is this a new seep or a seep that has been previously documented? NA    
 4. Are there any odors? If yes, describe odor and intensity ..... NA

5. Is there vegetation growing at the seep location? ..... NA    
 6. Is the shoreline discolored by suspected contamination? If yes, describe appearance, location, and square footage .....

7. Is there vegetation growing on the shoreline? ..... kelp / rockweed    
 8. Is any suspect ordnance found on the shoreline? If yes, describe the location and approximate size and shape, and color without approaching ordnance. Note location on back of form. Secure area. Stop work! Notify Navy CSO immediately! .....

9. Was there any other manmade debris (exclude items from off-island activities) found on the shoreline? If yes, describe debris, whether it could be contributing to contamination, and provide number of pieces or square footage of area .....

Additional Notes: Rusty pipe sections, scrap metal debris, concrete pieces of rebar mesh in places in rip rap. Not a source of petroleum contamination.

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: SA 80, Steam Plant Sample Location: 04-158  
 Inspector(s): Robert Boyd, Sherri A. Wandaich Date/Time: 9/3/12 11:50  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 50°F, raining, wind - 35 mph

### Well Data

Diameter of Well Casing: 4"  
 Depth to Water Below Top of Casing (feet): 18.21  
 Total Depth of Well Below Top of Casing (feet): 28.07 ft + btoc  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 9.26  
 Gallons per Foot: 0.65 Gallons in Well: 6.41  
 Three Times Casing Volume: 14.2 Gallons Purged from Well: 3.5

### Water Sample Data

Sample Number: 04-158-2012  
 Time Sample Collected: 12:50  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): moderate odor - petroleum, Sheen, blue/orange particulate  
 Stabilized? Yes 3 Casing Volumes Removed? No

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
INITIAL	1226	6.06	0.483	49.3	1.13	7.85	0	-10
0.5	1230	6.05	0.453	51.1	0.00	7.95	0	-18
1.0	1234	6.03	0.445	50.7	0.00	7.99	0	-21

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: SE 80, Steam Plant Sample Location: 04-801  
 Inspector(s): A. Lewis, R. Baycl Date/Time: 9/4/12 0935  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 52°F, moderate wind, overcast

### Well Data

Diameter of Well Casing: 2"  
 Depth to Water Below Top of Casing (feet): 21.21  
 Total Depth of Well Below Top of Casing (feet): 27.85  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 6.64  
 Gallons per Foot: 0.16 Gallons in Well: 1.06  
 Three Times Casing Volume: 3.19 Gallons Purged from Well: 3.5

### Water Sample Data

Sample Number: 04-801-2017  
 Time Sample Collected: 04-801-2017 1015  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): No odors  
 Stabilized? NO 3 Casing Volumes Removed? yes

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (‰)	Redox (mv)

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: South of Runway 18/36      Sample Location: 02-231  
 Inspector(s): B. Giles / D. Balmer      Date/Time: 8/27/12 0910  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: cloudy, mild, calm, lt rain      ~50° F (slw)

### Well Data

Diameter of Well Casing: 2-in.  
 Depth to Water Below Top of Casing (feet): 14.5'  
 Total Depth of Well Below Top of Casing (feet): 18.55' tc      (18.68' tc in 2011)  
 Purge Method: low flow peristaltic      Intake at 16.6 ft  
 Calculate if well parameters do not stabilize per the work plan: (using 2011 DRB) (slw)  
 Length of Water Column in Well (feet): 4.1'  
 Gallons per Foot: 0.16      Gallons in Well: 0.66 gal  
 Three Times Casing Volume: 2.0 gal      Gallons Purged from Well: 1.98  
(DKB) 8/27/12

### Water Sample Data

Sample Number: 02-231-2012 and 02-241-2012 (duplicate)  
 Time Sample Collected: 1024      and 1634  
 Sampling Method: low flow peristaltic  
 Remarks (Color/Odor): rotten odor to water  
 Stabilized? No      3 Casing Volumes Removed? Yes

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: South of Runway 16/36 Sample Location: AS-1  
 Inspector(s): B Giles / D. Balmer Date/Time: 8/27/12 1600  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: cloudy, cool, ~50° F

### Well Data

Diameter of Well Casing: 2-in.  
 Depth to Water Below Top of Casing (feet): 13.71 ft.  
 Total Depth of Well Below Top of Casing (feet): 29.31 in 2011, 29.25 on 8/27/12 - SW  
 Purge Method: low flow peristaltic. Intake set at 27.0 ft.  
 Calculate if well parameters do not stabilize per the work plan: (using 20:1 OTR) - SW  
 Length of Water Column in Well (feet): 15.6  
 Gallons per Foot: 0.16 Gallons in Well: 2.496  
 Three Times Casing Volume: 7.44 Gallons Purged from Well: 2.5

### Water Sample Data

Sample Number: AS-1-2012  
 Time Sample Collected: 1705  
 Sampling Method: low flow peristaltic  
 Remarks (Color/Odor): CLEAR, NO ODOR  
 Stabilized? yes 3 Casing Volumes Removed? NA

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
INITIAL	1638	6.48	0.647	12.9	0.00	6.84	0.0	-113

### Seep and Shoreline Visual Inspection Checklist

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: South of Runway 18/36 Well No.: NA  
 Inspector(s): B. Giles / D Balmer Date/Time: 8/28/12 0820  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: cloudy, mild. ~50° F SW

1. Was a contaminated seep located? If yes, describe the seep (including length and width) and flow rate. Yes No

2. Is the seep flowing directly into a surface water body? NA    
 3. Is this a new seep or a seep that has been previously documented? NA  
 4. Are there any odors? If yes, describe odor and intensity NA

5. Is there vegetation growing at the seep location? NA

6. Is the shoreline discolored by suspected contamination? If yes, describe appearance, location, and square footage.    
one small area of petroleum stained rock (4'x2') on shore near upper bridge.  
several extensive areas of the shoreline north of the upper bridge contain black-stained sediment just beneath the surface, which creates sheen when disturbed in water.

7. Is there vegetation growing on the shoreline? Grasses and rockweed

8. Is any suspect ordnance found on the shoreline? If yes, describe the location and approximate size and shape, and color without approaching ordnance. Note location on back of form. Secure area. Stop work! Notify Navy CSO immediately!

9. Was there any other manmade debris (exclude items from off-island activities) found on the shoreline? If yes, describe debris, whether it could be contributing to contamination, and provide number of pieces or square footage of area.

Scattered metal debris, cables, metal siding, observed along shoreline, not sources of petroleum contamination.  
 Additional Notes: large pieces of concrete with rebar were present in areas of former bridges.

**Sediment Sampling  
Visual Inspection Checklist**

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
Site Name: South of Runway 18-73<sup>36 RB</sup> Sample No.: NSWSD-25-2012 [1030]  
Dup: NSWSD-125-2012 [1040]  
Inspector(s): A. Lewis, R. Boyd Date/Time: 8/28/12 1025  
Company: Sealaska Environmental Services, LLC  
Weather/Temperature: 53° F, overcast

1. Describe sediment appearance (color, grain size, organic matter, etc.). Is contamination suspected? ...  Yes  No

Sandy sediment, Black, seaweed along surface of sediment

2. Are there any odors? If yes, describe the odor and intensity and if it is suspected contamination .....  Yes  No

Moderate smell of petroleum

3. Is there manmade debris within 200 feet of the sampling location that could affect sample results? ....  Yes  No

None

4. Is there a petroleum sheen or color change on the surface water or sediment after it was disturbed? ....  Yes  No

light sheen seen across sediment 1/4" below surface, sheen seen in water after sample was complete

5. Is there vegetation growing in the sediment or nearby? .....  Yes  No

6. Are there any insects, invertebrates, or fish in or on the sediment or evidence of wildlife nearby? .....  Yes  No

Eagles along shoreline, 50ft down stream; salmon seen swimming by

Additional Notes:

**Sediment Sampling  
Visual Inspection Checklist**

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
Site Name: South of Runway 18-310 Sample No.: NSWSD-45-2012 [1000]  
Dup: NSWSD-145-2012 [1010]  
Inspector(s): A. Lewis, R. Boyd Date/Time: 8/27/12 0955  
Company: Sealaska Environmental Services, LLC  
Weather/Temperature: 53° F, overcast

1. Describe sediment appearance (color, grain size, organic matter, etc.). Is contamination suspected? ...  Yes  No  
Sediment was grey in color, small grain/sand, no organic matter on sediment at sample location, seaweed observed near location
2. Are there any odors? If yes, describe the odor and intensity and if it is suspected contamination .....  Yes  No  
No odors
3. Is there manmade debris within 200 feet of the sampling location that could affect sample results? ....  Yes  No  
Sample location is located between two creosote piling runways across water
4. Is there a petroleum sheen or color change on the surface water or sediment after it was disturbed? ....  Yes  No
5. Is there vegetation growing in the sediment or nearby? Grass along shoreline healthy .....  Yes  No
6. Are there any insects, invertebrates, or fish in or on the sediment or evidence of wildlife nearby? .....  Yes  No

Additional Notes: Dup for PAHs only

**Sediment Sampling  
Visual Inspection Checklist**

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: South of Runway 18-36 Sample No.: NSWSD-58-2012[0910]  
 Inspector(s): A. Lewis, R. Boyd Date/Time: 8/28/12 0900  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 54°F, overcast

1. Describe sediment appearance (color, grain size, organic matter, etc.). Is contamination suspected? ...  Yes  No

Black sediment, loose sediment with 1/4"-1/2" rocks  
light seaweed along surface

2. Are there any odors? If yes, describe the odor and intensity and if it is suspected contamination .....

Heavy petroleum odor

3. Is there manmade debris within 200 feet of the sampling location that could affect sample results? ....

Piping along shoreline (dead end open) w/ no free flowing water - low likelihood of contributing to petroleum contamination. Piping on vessel over water - low likelihood of contributing to petroleum contamination

4. Is there a petroleum sheen or color change on the surface water or sediment after it was disturbed? ....

Sheen (heavy) observed after sample collection

5. Is there vegetation growing in the sediment or nearby? .....

6. Are there any insects, invertebrates, or fish in or on the sediment or evidence of wildlife nearby? .....   Sand shrimp

Additional Notes: MS/MSD for PAHs only

### Surface Water Sampling Visual Inspection Checklist

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: South of Runway 18-36 Sample No.: NSWSD-8-2012 [1115]  
 Inspector(s): A. Lewis, R. Baycl Date/Time: 8/28/12 1100  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 58°F, overcast

- |   | Yes                      | No                                  |
|---|--------------------------|-------------------------------------|
| 1. Is there any sheen or visible contamination on or in the water? .....  | <input type="checkbox"/> | <input checked="" type="checkbox"/> |
| 2. Are there any odors (e.g., petroleum or sulfide/rotten egg)? If yes, describe the odor and intensity.....  | <input type="checkbox"/> | <input checked="" type="checkbox"/> |
| <hr/>   |                          |                                     |
| 3. Is there manmade debris within 200 feet of the sampling location that could affect sample results? ....  | <input type="checkbox"/> | <input checked="" type="checkbox"/> |
| 4. If so, describe: _____   |                          |                                     |
| 5. Is there discoloring along the banks of the water body that may be due to contamination? If yes, describe appearance, location, and square footage. .... | <input type="checkbox"/> | <input checked="" type="checkbox"/> |

6. Describe the sample (clear, colored, muddy, odors, etc.):  
Clear water, good flow, no odors

7. Is there vegetation growing nearby? ..... vegetation along shoreline    
 8. Are there signs of wildlife use nearby (birds, fish, etc.)? healy crows, eagle, small song birds    
 9. Estimate volume of flow or stream size (width and depth) if sample collected from a stream or seep: \_\_\_\_\_

Collected at stream, 25 ft wide x 16 inches deep

8. Is erosion occurring? If yes, describe conditions and severity.....    
Erosion along retaining wall ~10ft upstream & upgradient from sample location  
not likely contributing to petroleum contamination. See photos 9/12/12 1053  
 9. Is deposition occurring in the water body? If yes, describe conditions .....

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: SWMU 14      Sample Location: 01-153  
 Inspector(s): B Giles / D Balmer      Date/Time: 8/30/12 0815  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: cloudy, cool, drizzle      ~50°F (SW)

### Well Data

Diameter of Well Casing: 1 1/2 in.  
 Depth to Water Below Top of Casing (feet): 18.46' re.  
 Total Depth of Well Below Top of Casing (feet): 27.07 (2010) 27.19 (2012) (SW)  
 Purge Method: Low flow peristaltic      Intake set at 22.7'  
 Calculate if well parameters do not stabilize per the work plan: (using 2010 total depth)  
 Length of Water Column in Well (feet): 8.61'  
 Gallons per Foot: 0.10 g      Gallons in Well: 0.86 g  
 Three Times Casing Volume: 2.58 g      Gallons Purged from Well: 3.0 g

### Water Sample Data

Sample Number: 01-153-2012  
 Time Sample Collected: 0910  
 Sampling Method: Low flow peristaltic  
 Remarks (Color/Odor): From biofouling in water  
 Stabilized? NO      3 Casing Volumes Removed? YES

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)

### Monitoring Well (Groundwater) Gauging Visual Inspection Checklist

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: SWMU 17 Well No.: 05-735  
 Inspector(s): A. Lewis, R. Bayl Date/Time: 9/4/12 1400  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 55°F, overcast, light wind

- |  | Yes                                 | No                                  |
|--|-------------------------------------|-------------------------------------|
| 1. Was the monitoring well located? .....  | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| 2. Is the well clearly labeled? If not, please re-label. ....  | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| 3. Is there a cap on the monitoring well? .....  | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| 4. Specify type of cap: <u>2" Butterfly</u> .....  |                                     |                                     |
| 5. Specify size and number of bolts on flush-mount cap: <u>NA</u> .....                                      |                                     |                                     |
| 6. Is there any evidence of tampering with the cap or well casing? .....                                     | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| 7. Is the monument in good condition? .....  | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| 8. Is the casing in good condition? .....  | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| 9. Are there any odors (e.g., petroleum or sulfide/rotten egg)? If yes, describe the odor and intensity..... | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| 10. Is there an oily sheen on the water? .....   | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| 11. Is the well dry? .....   | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| 12. Is there product in the well? .....  | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |
| 13. If so, product thickness <u>N/A</u> .....  |                                     |                                     |
| 14. Is the well depth consistent with past depth measurements? .....   | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| 15. Are there well protections? Type: <u>Bollards (3)</u> .....  | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| 16. Previous well depth: <u>21.80 ft bto c</u> Current well depth: <u>21.80 ft bto c</u> <u>hard bottom</u>  |                                     |                                     |
| 17. Depth to water: <u>15.98 ft bto c</u>  |                                     |                                     |
| 18. PID reading at wellhead: <u>0.0 ppm</u> Breathing Zone: <u>0.0 ppm</u>                                   |                                     |                                     |

Additional notes: within 75 ft from well these items noted: 5 heavy duty equipment weatheres, 15 pallets of crush drums, two old (not usable) mobil generators, 2 white 30 gallon drums, 1 yellow 55 gallon drum labeled hazardous substance, 10K used oil tank, broken down suburban vehicle, Area around power house is not managed well.

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: SWMU 17 Sample Location: PP-05  
 Inspector(s): A. Lewis, R. Boyd Date/Time: 9/5/12 1025  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 52° F, overcast

### Well Data

Diameter of Well Casing: 2"  
 Depth to Water Below Top of Casing (feet): 10.91  
 Total Depth of Well Below Top of Casing (feet): 16.39 (2010) 16.39 (Hard bottom) (2012) (S)  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 5.48 (2010 DTB used)  
 Gallons per Foot: 0.16 Gallons in Well: 0.88  
 Three Times Casing Volume: 2.63 Gallons Purged from Well: 1.50

### Water Sample Data

Sample Number: PP-05-2012  
 Time Sample Collected: 1125  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): No odor during purge. Moderate petroleum odor on tubing. Clear water  
 Stabilized? Yes 3 Casing Volumes Removed? No

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
Initial	1048	6.37	0.661	12	0.94	8.27	0.0	-52
.25	1053	6.38	0.662	17	0.89	8.32	0.0	-52
.50	1058	6.38	0.661	39	0.38	8.30	0.0	-52
.75	1063	6.39	0.660	41	0.31	8.29	0.0	-53
1.00	1108	6.40	0.660	40	0.00	8.31	0.0	-54
1.25	1113	6.41	0.661	40	0.00	8.33	0.0	-55
1.50	1118	6.41	0.666	43	0.00	8.35	0.0	-56
<b>TEST KIT RESULTS</b>								
DO (ppm)		Fe <sup>2+</sup> (ppm)		CO <sub>2</sub> (ppm)				
N/A		N/A		N/A				

Notes: purged well similar to previous years notes due to heavy drawdown.

#### Well Casing Volumes

GAL/FOOT 3/4" = 0.02    1-1/4" = 0.077    2" = 0.16    3" = 0.37    4" = 0.65  
 1-1/2" = 0.10    2-1/2" = 0.24    3-1/2" = 0.50    6" = 1.46

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: SVMU 17 Sample Location: R-1  
 Inspector(s): A. Lewis, R. Bag Date/Time: 9/4/12 1530  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 55°F, Overcast, light wind

### Well Data

Diameter of Well Casing: 2"  
 Depth to Water Below Top of Casing (feet): 2.74  
 Total Depth of Well Below Top of Casing (feet): 17.03 (2010) 17.07 (2012)  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 14.79 (2010 DTB used)  
 Gallons per Foot: 0.16 Gallons in Well: 2.37  
 Three Times Casing Volume: 7.10 Gallons Purged from Well: 2.5

### Water Sample Data

Sample Number: R-1-2012  
 Time Sample Collected: 1600  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): light smudged nitro / clear water  
 Stabilized? yes 3 Casing Volumes Removed? NO

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
Initial	1543	6.48	0.484	7	3.01	8.42	0.0	-16
.5	1547	6.47	0.485	8	2.20	7.97	0.0	-18
1.0	1551	6.47	0.485	4	1.84	7.68	0.0	-21

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: SWMU 58      Sample Location: 12-114  
 Inspector(s): A. Lewis, R. Boyd      Date/Time: 8/31/12 0940  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 52° F, overcast, fog, windy

### Well Data

Diameter of Well Casing: 2"  
 Depth to Water Below Top of Casing (feet): 9.98  
 Total Depth of Well Below Top of Casing (feet): 17.90  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 7.92  
 Gallons per Foot: 0.16      Gallons in Well: 1.27  
 Three Times Casing Volume: 3.80      Gallons Purged from Well: 4.0

### Water Sample Data

Sample Number: 12-114-2012  
 Time Sample Collected: 1035  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): clear water without odor  
 Stabilized? NO      3 Casing Volumes Removed? yes

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
Initial	1000	5.56	0.290	5	1.34	7.12	0.0	191
.5	1004	5.53	0.298	4	0.21	7.28	0.0	192
1.0	1008	5.54	0.293	5	0.00	7.26	0.0	98

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: SWML 58      Sample Location: 12-203  
 Inspector(s): A. Lewis, R. Boyd      Date/Time: 8/31/12 1200  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 51° F, overcast, wind

### Well Data

Diameter of Well Casing: 2"  
 Depth to Water Below Top of Casing (feet): 12.70  
 Total Depth of Well Below Top of Casing (feet): 19.89  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 7.19  
 Gallons per Foot: 0.16      Gallons in Well: 1.15  
 Three Times Casing Volume: 3.45      Gallons Purged from Well: 2.5

### Water Sample Data

Sample Number: 12-203-2012  
 Time Sample Collected: 1245  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): light smell of petroleum, clear water  
 Stabilized? yes      3 Casing Volumes Removed? No

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (‰)	Redox (mv)
Initial	1219	6.43	0.991	41	6.13	7.01	0.0	-112
.5	1223	6.45	0.981	21	6.08	7.08	0.0	-111
1.0	1227	6.47	0.978	11	6.00	7.05	0.0	-114
1.5	1231	6.49	0.973	8	6.00	7.03	0.0	-115
2.0	1235	6.49	0.975	5	6.00	7.00	0.0	-117
2.5	1239	6.50	0.971	5	6.00	6.98	0.0	-118

### TEST KIT RESULTS

DO (ppm)	Fe <sup>2+</sup> (ppm)	CO <sub>2</sub> (ppm)
N/A	N/A	N/A

Notes: Breathing zone PID: 0.0 ppm

### Well Casing Volumes

GAL/FOOT    ¾" = 0.02    1-1/4" = 0.077    2" = 0.16    3" = 0.37    4" = 0.65  
                  1-1/2" = 0.10    2-1/2" = 0.24    3-1/2" = 0.50    6" = 1.46

### Seep and Shoreline Visual Inspection Checklist

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: SWML 58 Well No.: 12-601  
 Inspector(s): A. Lewis, R. Boyd Date/Time: 8/31/12 1445  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 53°F, heavy rain, overcast, wind

1. Was a contaminated seep located? If yes, describe the seep (including length and width) and flow rate. Yes No

N/A

2. Is the seep flowing directly into a surface water body? N/A    
 3. Is this a new seep or a seep that has been previously documented? N/A    
 4. Are there any odors? If yes, describe odor and intensity N/A

5. Is there vegetation growing at the seep location? N/A    
 6. Is the shoreline discolored by suspected contamination? If yes, describe appearance, location, and square footage N/A

7. Is there vegetation growing on the shoreline?    
 8. Is any suspect ordnance found on the shoreline? If yes, describe the location and approximate size and shape, and color without approaching ordnance. Note location on back of form. Secure area. Stop work! Notify Navy CSO immediately!

N/A

9. Was there any other manmade debris (exclude items from off-island activities) found on the shoreline? If yes, describe debris, whether it could be contributing to contamination, and provide number of pieces or square footage of area.

Additional Notes: 2 fallen 15 ft wooden powerline poles to the south, poles appear to be covered with creosote but since this is a DRO site, the poles are not a potential source. Pipeline with wooden supports of petroleum contamination (pipeline appears to be abandoned)

Additional Notes: Naturally occurring water in drainage ~ 1 inch deep.

**Monitoring Well (Groundwater) Gauging

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO55  
 Site Name: SWMU 60 Tank Farm A Sample Location: LC5A  
 Inspector(s): B Giles / D Balmer Date/Time: 9/5/12 1100  
 Company: Sealaska  
 Weather/Temperature: Partly cloudy, breezy, cold ~50°F (SW)

### Well Data

Diameter of Well Casing: 2-in.  
 Depth to Water Below Top of Casing (feet): 6.23'  
 Total Depth of Well Below Top of Casing (feet): 12.55 (2011) 12.57 (2012) (SW)  
 Purge Method: Low flow peristaltic Intake to 9.5' bc.  
 Calculate if well parameters do not stabilize per the work plan: (using 2011 DRB)  
 Length of Water Column in Well (feet): 6.32'  
 Gallons per Foot: 0.16 g Gallons in Well: 1.01 g  
 Three Times Casing Volume: 3.03 g Gallons Purged from Well: 2.0 g

### Water Sample Data

Sample Number: LC5A-2012  
 Time Sample Collected: 1140  
 Sampling Method: low flow peristaltic  
 Remarks (Color/Odor): None  
 Stabilized? Yes 3 Casing Volumes Removed? NA

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO55  
 Site Name: SUMU 60 Tank Farm A Sample Location: 651  
 Inspector(s): B Giles / D Balmer Date/Time: 9/5/12 1455  
 Company: Senaska  
 Weather/Temperature: Partly cloudy, breezy, cold ~50° F

### Well Data

Diameter of Well Casing: 2-in.  
 Depth to Water Below Top of Casing (feet): 9.11' to  
 Total Depth of Well Below Top of Casing (feet): 15.30 (2011) 15.29 (2012)  
 Purge Method: Low flow peristaltic Intake at 12.0' to  
 Calculate if well parameters do not stabilize per the work plan: (using 2011 data)  
 Length of Water Column in Well (feet): 6.19'  
 Gallons per Foot: 0.16g Gallons in Well: 0.99g  
 Three Times Casing Volume: 2.97g Gallons Purged from Well: 3.0g

### Water Sample Data

Sample Number: 651-2012  
 Time Sample Collected: 1550  
 Sampling Method: Low flow peristaltic  
 Remarks (Color/Odor): Some brown bio fouling on tubing.  
 Stabilized? No 3 Casing Volumes Removed? yes

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
INITIAL	1516	6.43	0.294	125.0	0.46	6.76	0.0	2
.5	1521	6.25	0.293	27.5	0.00	6.61	0.0	-22

|--|-------------------------------------|-------------------------------------|
| 7. Is there vegetation growing on the shoreline? .....   | <input checked="" type="checkbox"/> | <input type="checkbox"/>            |
| 8. Is any suspect ordnance found on the shoreline? If yes, describe the location and approximate size and shape, and color without approaching ordnance. Note location on back of form. Secure area. Stop work! Notify Navy CSO immediately! ..... | <input type="checkbox"/>            | <input checked="" type="checkbox"/> |

- |  |                                     |                          |
|--|-------------------------------------|--------------------------|
| 9. Was there any other manmade debris (exclude items from off-island activities) found on the shoreline? If yes, describe debris, whether it could be contributing to contamination, and provide number of pieces or square footage of area..... | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
|--|-------------------------------------|--------------------------|

Numerous metal debris, cables, rebar, and concrete pieces near  
 Additional Notes: downstream bridges Not a source of petroleum contamination.

**Sediment Sampling  
Visual Inspection Checklist**

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
Site Name: SWMU 60 Sample No.: 8525-2012 [1215]  
Inspector(s): A Lewis, R. Boyd Date/Time: 8/28/12 1145  
Company: Sealaska Environmental Services, LLC  
Weather/Temperature: 60°, light wind, overcast

1. Describe sediment appearance (color, grain size, organic matter, etc.). Is contamination suspected? ...  Yes  No

light organic matter in sediment, small grain sand, light brown at surface 1/8" deep black.

2. Are there any odors? If yes, describe the odor and intensity and if it is suspected contamination .....  Yes  No

Heavy smell of petroleum

3. Is there manmade debris within 200 feet of the sampling location that could affect sample results? ....  Yes  No

4. Is there a petroleum sheen or color change on the surface water or sediment after it was disturbed? ....  Yes  No

sheen & color change 1/8" deep from light brown to black

5. Is there vegetation growing in the sediment or nearby? ..... along shoreline/bank  Yes  No

6. Are there any insects, invertebrates, or fish in or on the sediment or evidence of wildlife nearby? .....  Yes  No  
Eagles, teal, cormorant seen down gradient 75'

### Surface Water Sampling Visual Inspection Checklist

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: SWMU 60 Sample No.: 852-2012 [240]  
 Inspector(s): A. Lewis, R. Boyd Date/Time: 8/28/12 / 1300  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 60°, light wind, overcast

1. Is there any sheen or visible contamination on or in the water? .....  Yes  No

2. Are there any odors (e.g., petroleum or sulfide/rotten egg)? If yes, describe the odor and intensity .....  Yes  No

*at 28/12 RB*  
~~light~~ Moderate smell of petroleum

3. Is there manmade debris within 200 feet of the sampling location that could affect sample results? ....  Yes  No

4. If so, describe: \_\_\_\_\_

5. Is there discoloring along the banks of the water body that may be due to contamination? If yes, describe appearance, location, and square footage. ....  Yes  No

From culvert/basin locations to Sweeper creek, orange discolored sand/sediment 1/2" below top layer of sediment black discolored sand: moderate

6. Describe the sample (clear, colored, muddy, odors, etc.): Smell of petroleum

water was clear below surface, orange floating particulate seen, light white foam along surface.

7. Is there vegetation growing nearby? ..... along banks, not below shoreline  Yes  No

8. Are there signs of wildlife use nearby (birds, fish, etc.)? teal, eagle, coho seen nearby  Yes  No

9. Estimate volume of flow or stream size (width and depth) if sample collected from a stream or seep: \_\_\_\_\_

8ft across, 10" deep

8. Is erosion occurring? If yes, describe conditions and severity .....  Yes  No

9. Is deposition occurring in the water body? If yes, describe conditions .....  Yes  No

Additional Notes: previously sampled location was dry, moved down gradient along stream body approx 75' as per Annette Franzen from corresponding sediment location

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: SWMU 61      Sample Location: 14-210  
 Inspector(s): B. Giles / D. Balmer      Date/Time: 9/1/12 0920  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: Rain, wind, cold      ~50°F (slw)

### Well Data

Diameter of Well Casing: 1 1/4 in  
 Depth to Water Below Top of Casing (feet): 2.34'  
 Total Depth of Well Below Top of Casing (feet): 7.49' to (2011) (1 2012) (slw)  
 Purge Method: Low flow peristaltic      Intake at 6.5'  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 5.15'  
 Gallons per Foot: 0.077      Gallons in Well: 0.40  
 Three Times Casing Volume: 1.19 g      Gallons Purged from Well: 1.25 g

### Water Sample Data

Sample Number: 14-210-2012  
 Time Sample Collected: 1100  
 Sampling Method: Low flow peristaltic  
 Remarks (Color/Odor): None  
 Stabilized? No      3 Casing Volumes Removed? Yes

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
INITIAL	0941	6.17	0.437	18.6	0.52	9.29	0.0	-49
.25	0946	6.31	0.355	42.8	0.72	9.15	0.0	-69

### Surface Water Sampling Visual Inspection Checklist

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: SWMU 61 Sample No.: NL-C4-2012 (1000)  
 Inspector(s): A. Lewis, R. Boyd Date/Time: 9/6/12 0945  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 50°F, moderate wind, partial overcast

- |   | Yes No   |
|---|--|
| 1. Is there any sheen or visible contamination on or in the water? .....  | <input type="checkbox"/> <input checked="" type="checkbox"/> |
| 2. Are there any odors (e.g., petroleum or sulfide/rotten egg)? If yes, describe the odor and intensity.....  | <input type="checkbox"/> <input checked="" type="checkbox"/> |
| <hr/>   |  |
| 3. Is there manmade debris within 200 feet of the sampling location that could affect sample results? ....  | <input type="checkbox"/> <input checked="" type="checkbox"/> |
| 4. If so, describe: <u>NA</u>   |  |
| 5. Is there discoloring along the banks of the water body that may be due to contamination? If yes, describe appearance, location, and square footage. .... | <input type="checkbox"/> <input checked="" type="checkbox"/> |
| <hr/>   |  |
| 6. Describe the sample (clear, colored, muddy, odors, etc.):  |  |
| <u>Clearwater (bottom o-stream visible), No odors</u>   |  |
| <hr/>   |  |
| 7. Is there vegetation growing nearby? .....  | <input checked="" type="checkbox"/> <input type="checkbox"/> |
| 8. Are there signs of wildlife use nearby (birds, fish, etc.)? <u>Raven, pink salmon, Dolly Varden</u>  | <input checked="" type="checkbox"/> <input type="checkbox"/> |
| 9. Estimate volume of flow or stream size (width and depth) if sample collected from a stream or seep: _____  |  |
| <u>30ft wide, 4ft deep</u>  |  |
| 8. Is erosion occurring? If yes, describe conditions and severity.....  | <input type="checkbox"/> <input checked="" type="checkbox"/> |
| <hr/>   |  |
| 9. Is deposition occurring in the water body? If yes, describe conditions .....   | <input type="checkbox"/> <input checked="" type="checkbox"/> |

### Sediment Sampling Visual Inspection Checklist

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: SWMU 61 Sample No.: NL-048-2012 [1015]  
DUP: NL-145-2012 [1070]  
 Inspector(s): A. Lewis, R. Boyd Date/Time: 9/6/12 0945  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 50°, light wind, partial sun

1. Describe sediment appearance (color, grain size, organic matter, etc.). Is contamination suspected? ...  Yes  No  
Dark Brown, silty clay with organics (Roots)
2. Are there any odors? If yes, describe the odor and intensity and if it is suspected contamination .....  Yes  No
3. Is there manmade debris within 200 feet of the sampling location that could affect sample results? ....  Yes  No
4. Is there a petroleum sheen or color change on the surface water or sediment after it was disturbed? ....  Yes  No
5. Is there vegetation growing in the sediment or nearby? .....  Yes  No
- \*6. Are there any insects, invertebrates, or fish in or on the sediment or evidence of wildlife nearby? .....  Yes  No

Additional Notes: \_\_\_\_\_

\*6. No insects or invertebrates in sediment, <sup>at 9/6/12</sup> along ~~site~~ within stream  
 Polly Varden: Pink salmon seen swimming by

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO55  
 Site Name: SWMU 62 Eagle Bay Sample Location: AMWV-704  
 Inspector(s): A. Lewis, R. Boyd Date/Time: 9/10/12 1250  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 51° F, rain, moderate wind

### Well Data

Diameter of Well Casing: 2"  
 Depth to Water Below Top of Casing (feet): 7.09  
 Total Depth of Well Below Top of Casing (feet): 16.59 (2011) (2012)  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 9.50  
 Gallons per Foot: 0.16 Gallons in Well: 1.52  
 Three Times Casing Volume: 4.56 Gallons Purged from Well: 3.0

### Water Sample Data

Sample Number: AMWV-704-2012  
 Time Sample Collected: 1335  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): Clear water w. th some orange flakes, odorless.  
 Stabilized? Yes 3 Casing Volumes Removed? No

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
initial	1312	5.98	0.219	16	1.70	8.47	0.0	103
1.5	1316	5.92	0.214	16	1.27	8.22	0.0	100
2.0	1320	5.91	0.212	15	1.34	8.16	0.0	98
2.5	1324	5.91	0.213	16	1.37	8.14	0.0	97
3.0	1328	5.90	0.213	15	1.40	8.15	0.0	96
<b>TEST KIT RESULTS</b>								
DO (ppm)		Fe <sup>2+</sup> (ppm)		CO <sub>2</sub> (ppm)				
N/A		N/A		N/A				

Notes: Breathing zone PID: 0.0

Orange particulate seen at initial, allowed to purge one gallon prior to connecting to flow cell.

### Well Casing Volumes

GAL/FOOT 3/4" = 0.02    1-1/4" = 0.077    2" = 0.16    3" = 0.37    4" = 0.65  
 1-1/2" = 0.10    2-1/2" = 0.24    3-1/2" = 0.50    6" = 1.46

# WATER SAMPLING LOG

PAGE 1/2

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO55  
 Site Name: SWTU 62 Eagle Bay Sample Location: RW-303-14  
 Inspector(s): B Giles / D Balmer Date/Time: 9/10/12 1345  
 Company: Sealaska  
 Weather/Temperature: Cloudy, rain, breezy, 45°F

### Well Data

Diameter of Well Casing: 4-in.  
 Depth to Water Below Top of Casing (feet): 7.96' to.  
 Total Depth of Well Below Top of Casing (feet): 19.45' (2010) 18.8' (2012)  
 Purge Method: low flow peristaltic Intake at 13.7' to.  
 Calculate if well parameters do not stabilize per the work plan: (using 2nd or 3rd Screen 4-17.95  
 Length of Water Column in Well (feet): 11.49' Set Scr. 7.96' to 19.45' Intake - 13.7'  
 Gallons per Foot: 0.65g Gallons in Well: 7.47g  
 Three Times Casing Volume: 22.4g Gallons Purged from Well: 8.13g

### Water Sample Data

Sample Number: RW-303-14-2012  
 Time Sample Collected: 1555  
 Sampling Method: low flow peristaltic  
 Remarks (Color/Odor): orange floc in water No shren  
 Stabilized? Yes No 3 Casing Volumes Removed? ~~NA~~ Yes  
SW 9/10/12 SW 9/12/12

### Seep and Shoreline Visual Inspection Checklist

Project Name: TO 55 Adak LTM 2012 Project No.: TO 55  
 Site Name: SWMU 62 East Canal Well No.: NA  
 Inspector(s): B Giles / D Balmer Date/Time: 9/11/12 1515  
 Company: Sealaska  
 Weather/Temperature: Cloudy, breezy, cold

1. Was a contaminated seep located? If yes, describe the seep (including length and width) and flow rate.....  Yes  No

Seeps occur along 120-ft shoreline behind Boom 8. Pooled petroleum product behind one segment of boom, with petroleum sheen passing beyond boom - to be contained behind Boom 3.

2. Is the seep flowing directly into a surface water body?..... East Canal  Yes  No  
 3. Is this a new seep or a seep that has been previously documented? Previously documented.  
 4. Are there any odors? If yes, describe odor and intensity.....  Yes  No

Fuel odor at boom at location.  
9/11/12

5. Is there vegetation growing at the seep location?..... Grasses  Yes  No  
 6. Is the shoreline discolored by suspected contamination? If yes, describe appearance, location, and square footage.....  Yes  No

Black stained soil and vegetation along bank behind boom 8.  
Orange stained sediment and orange floe in water extending downstream to culverts.

7. Is there vegetation growing on the shoreline?.....  Yes  No  
 8. Is any suspect ordnance found on the shoreline? If yes, describe the location and approximate size and shape, and color without approaching ordnance. Note location on back of form. Secure area. Stop work! Notify Navy CSO immediately!.....  Yes  No

9. Was there any other manmade debris (exclude items from off-island activities) found on the shoreline? If yes, describe debris, whether it could be contributing to contamination, and provide number of pieces or square footage of area.....  Yes  No

Additional Notes: \_\_\_\_\_

### Surface Water Sampling Visual Inspection Checklist

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55

Site Name: SWM062 Sample No.: NL-09-2012 [1425]

Inspector(s): A. Lewis, R. Boyd Date/Time: 9/11/12 1415

Company: Sealaska Environmental Services, LLC

Weather/Temperature: 50°F, light wind, mist

- |    |   |   |                             |
|----|---|---|-----------------------------|
| 1. | Is there any sheen or visible contamination on or in the water? <u>light sheen seen when accessing surface water location</u> ..... | Yes <input checked="" type="checkbox"/> | No <input type="checkbox"/> |
| 2. | Are there any odors (e.g., petroleum or sulfide/rotten egg)? If yes, describe the odor and intensity.....                           | <input checked="" type="checkbox"/>     | <input type="checkbox"/>    |

Moderate smell of petroleum

3. Is there manmade debris within 200 feet of the sampling location that could affect sample results? ....

4. If so, describe: NA

5. Is there discoloring along the banks of the water body that may be due to contamination? If yes, describe appearance, location, and square footage. ....

approx 75' upstream inside boom sections black staining along shoreline, 3ft x 100ft

6. Describe the sample (clear, colored, muddy, odors, etc.):

Clear water, sediment (when disturbed) went down stream away from sample location.

7. Is there vegetation growing nearby?.....

8. Are there signs of wildlife use nearby (birds, fish, etc.)? shrike bird, Raven, teal.....

9. Estimate volume of flow or stream size (width and depth) if sample collected from a stream or seep: \_\_\_\_\_

35ft x 9" deep

8. Is erosion occurring? If yes, describe conditions and severity.....

9. Is deposition occurring in the water body? If yes, describe conditions .....

Additional Notes: Black oil seeping inside boom section along shoreline approximately 100ft up stream from sample location

### Sediment Sampling Visual Inspection Checklist

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55  
 Site Name: SWMU 62 Eagle Bay Sample No.: NL-09S-2012 [1445]  
 Inspector(s): A. Lewis, R. Boyd Date/Time: 9/11/12 1435  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 51°, light wind, partial sun

1. Describe sediment appearance (color, grain size, organic matter, etc.). Is contamination suspected? ...  Yes  No

Dark grey sand with light organic matter (grass roots)

2. Are there any odors? If yes, describe the odor and intensity and if it is suspected contamination .....

Moderate smell of petroleum, approx 75' down stream of tree  
boom sections/locations

3. Is there manmade debris within 200 feet of the sampling location that could affect sample results? ....

4. Is there a petroleum sheen or color change on the surface water or sediment after it was disturbed? ....

No color change, but light sheen after sediment was disturbed for sample.

5. Is there vegetation growing in the sediment or nearby? .....

6. Are there any insects, invertebrates, or fish in or on the sediment or evidence of wildlife nearby? .....

Tad, Ravi seen near stream bed  
Additional Notes:

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO55  
 Site Name: SWIMU 62 Sandy Cove Sample Location: 03-155  
 Inspector(s): A. Lewis, R. Boyd Date/Time: 9/8/12 / 0840  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 50° F. Overcast, mist

### Well Data

Diameter of Well Casing: 1 1/2"  
 Depth to Water Below Top of Casing (feet): 18.93  
 Total Depth of Well Below Top of Casing (feet): 25.00 (2011) 25.00 (Hard bottom)  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 6.07 (2011 DTB used)  
 Gallons per Foot: 0.10 Gallons in Well: 0.61  
 Three Times Casing Volume: 1.82 Gallons Purged from Well: 2.5

### Water Sample Data

Sample Number: 03-155-2012  
 Time Sample Collected: 0925  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): light yellow color water, odorless  
 Stabilized? NO 3 Casing Volumes Removed? yes

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (µS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (‰)	Redox (mv)
initial	0859	5.85	0.259	17	2.21	6.86	0.0	66
.5	0903	5.87	0.272	21	1.80	6.80	0.0	47
1.0	0907	5.91	0.268	14	1.71	6.71	0.0	33
1.5	0911	5.94	0.262	5	1.55	6.68	0.0	23
2.0	0915	5.96	0.255	4	1.57	6.64	0.0	19
2.5	0919	5.97	0.253	1	1.61	6.65	0.0	15

### TEST KIT RESULTS

DO (ppm)	Fe <sup>2+</sup> (ppm)	CO <sub>2</sub> (ppm)
N/A	N/A	N/A

Notes: Breathing zone PID: 0.0 ppm, Well head PID: 0.7 ppm

### Well Casing Volumes

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO55  
 Site Name: SWMU 62 Sandy Cove Sample Location: 03-802  
 Inspector(s): A. Lewis, R. Boyd Date/Time: 9/10/12 1025  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 51°F, overcast, moderate wind

### Well Data

Diameter of Well Casing: 2"  
 Depth to Water Below Top of Casing (feet): 16.54  
 Total Depth of Well Below Top of Casing (feet): 20.68 (soft bottom)  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 4.14  
 Gallons per Foot: 0.16 Gallons in Well: 0.66  
 Three Times Casing Volume: 1.99 Gallons Purged from Well: 2.0

### Water Sample Data

Sample Number: 03-802-2012  
 Time Sample Collected: 1100  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): colorless odorless water  
 Stabilized? NO 3 Casing Volumes Removed? yes

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO55  
 Site Name: SWMU 62 Sandy Cove Sample Location: MRP-MW2  
 Inspector(s): B Giles / D Balmer Date/Time: 9/8/12 1255  
 Company: Sealaska  
 Weather/Temperature: cloudy, breezy, cold 45°F

### Well Data

Diameter of Well Casing: 2-in.  
 Depth to Water Below Top of Casing (feet): 21.33' to  
 Total Depth of Well Below Top of Casing (feet): 24.93' to (2012) 27.92' our measurement  
 Purge Method: Low flow peristaltic Intake at 23.1' to  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 3.6'  
 Gallons per Foot: 0.16 g Gallons in Well: 0.58  
 Three Times Casing Volume: 1.73 g Gallons Purged from Well: 2.31

### Water Sample Data

Sample Number: MRP-MW2-2012 Screen - 15.3 - 24.8' g/s  
 Time Sample Collected: 1350 16.3 - 25.8' to.  
 Sampling Method: Low flow peristaltic Set screen 21.3 - 24.9  
 Remarks (Color/Odor): Orange fleec in water Intake 23.1'  
 Stabilized? No 3 Casing Volumes Removed? Yes

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
INITIAL	1319	6.06	0.363	54.4	6.85	6.91	0.0	30
.33	1323	6.17	0.368	23.7	0.51	6.71	0.0	-8
.66	1327	6.10	0.398	31.4	2.28	6.87	0.0	-19
.99	1331	6.15	0.429	60.6	0.40	6.77	0.0	-21
1.32	1335	6.14	0.436	61.2	0.20	6.78	0.0	-21
1.65	1339	6.13	0.442	37.6	0.16	6.74	0.0	-22
1.98	1343	6.11	0.449	0.0	0.04	6.78	0.0	-22
2.31	1347	6.10	0.462	9.4	0.00	6.80	0.0	-24
<b>TEST KIT RESULTS</b>								
DO (ppm)		Fe <sup>2+</sup> (ppm)		CO <sub>2</sub> (ppm)				
NA		NA		NA				

Notes: DTB measurement is questionable due to iron goo collecting  
in well. Soft goo at 24.9' - broke through.

### Well Casing Volumes

GAL/FOOT 3/4" = 0.02 1-1/4" = 0.077 2" = 0.16 3" = 0.37 4" = 0.65  
 1-1/2" = 0.10 2-1/2" = 0.24 3-1/2" = 0.50 6" = 1.46

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO55  
 Site Name: SWMU 62 Sandy Cove Sample Location: MW-107-1  
 Inspector(s): A. Lewis, R. Boyd Date/Time: 9/10/12 0920  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: 51°F, overcast, rain

### Well Data

Diameter of Well Casing: 2"  
 Depth to Water Below Top of Casing (feet): 18.18  
 Total Depth of Well Below Top of Casing (feet): 29.06  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 10.88  
 Gallons per Foot: 0.16 Gallons in Well: 1.74  
 Three Times Casing Volume: 5.22 Gallons Purged from Well: 3.0

### Water Sample Data

Sample Number: MW-107-1-2012  
 Time Sample Collected: 1005  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): light yellow color, moderate smell of petroleum  
 Stabilized? yes 3 Casing Volumes Removed? no

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
initial 1.5	0946	6.19	0.397	11	0.23	6.19	0.0	-17
2.0	0950	6.13	0.398	10	0.00	6.15	0.0	-23
2.5	0954	6.12	0.401	7	0.00	6.15	0.0	-21
3.0	0958	6.18	0.409	8	0.00	6.15	0.0	-29

### TEST KIT RESULTS

DO (ppm)	Fe <sup>2+</sup> (ppm)	CO <sub>2</sub> (ppm)
N/A	N/A	N/A

Notes: Breathing zone PEO: 0.0 ppm, well head: 1.9 ppm

Allowed well to purge ~ 15 gallons prior to connecting to flow cell. Yellow/orange particles seen floating inside flow cell's purge bucket. Start pump at 0931

### Well Casing Volumes

GAL/FOOT 3/4" = 0.02    1-1/4" = 0.077    2" = 0.16    3" = 0.37    4" = 0.65  
 1-1/2" = 0.10    2-1/2" = 0.24    3-1/2" = 0.50    6" = 1.46

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO55  
 Site Name: SWMU 62, Sandy Cove Sample Location: MW-187-1-2012  
 Inspector(s): A. Lewis, R. Boyd Date/Time: 9/7/12 1500  
 Company: Sea Alaska Environmental Services, LLC  
 Weather/Temperature: 51° F, light wind, mist

### Well Data

Diameter of Well Casing: 2"  
 Depth to Water Below Top of Casing (feet): 19.03  
 Total Depth of Well Below Top of Casing (feet): 22.29 (2011) 22.34 soft bottom  
 Purge Method: low-flow peristaltic  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): ~~3.26~~ (2011 DRO used) 3.26  
 Gallons per Foot: 0.16 Gallons in Well: 0.52  
 Three Times Casing Volume: 1.56 Gallons Purged from Well: 2.0

### Water Sample Data

Sample Number: MW-187-1-2012  
 Time Sample Collected: 1540  
 Sampling Method: low-flow peristaltic  
 Remarks (Color/Odor): clear, odorless water  
 Stabilized? No 3 Casing Volumes Removed? yes

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
initial	1513	6.16	0.463	4	1.21	6.85	0.0	-8
.5	1517	6.19	0.485	8	0.00	6.72	0.0	-24
1.0	1521	6.22	0.502	7	0.00	6.68	0.0	-33
1.5	1525	6.24	0.515	5	0.00	6.66	0.0	-39
2.0	1529	6.29	0.532	7	0.00	6.61	0.0	-50
<b>TEST KIT RESULTS</b>								
DO (ppm)		Fe <sup>2+</sup> (ppm)		CO <sub>2</sub> (ppm)				
N/A		N/A		N/A				

Notes: Breathing zone PID: 0.0 ppm

### Well Casing Volumes

GAL/FOOT 3/4" = 0.02 1-1/4" = 0.077 2" = 0.16 3" = 0.37 4" = 0.65  
 1-1/2" = 0.10 2-1/2" = 0.24 3-1/2" = 0.50 6" = 1.46

**Monitoring Well (Groundwater) Gauging  
Visual Inspection Checklist**

Project Name: 2012 Adak Long-Term Monitoring Project No.: TO 55

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: Tanker Shed      Sample Location: 04-290  
 Inspector(s): B. Giles / D. Balmer      Date/Time: 9/7/12 1005  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: Cloudy, misty, breezy, cold      ~50° F (1W)

### Well Data

Diameter of Well Casing: 2-in.  
 Depth to Water Below Top of Casing (feet): 6.97' to  
 Total Depth of Well Below Top of Casing (feet): 14.72' to  
 Purge Method: Low flow peristaltic      Intake at 10.5' to  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 7.75'  
 Gallons per Foot: 0.16 g      Gallons in Well: 1.24 g  
 Three Times Casing Volume: 3.72 g      Gallons Purged from Well: 2.5

### Water Sample Data

Sample Number: 04-290-2012 and 04-300-2012 (Dup)  
 Time Sample Collected: 1055      1105  
 Sampling Method: low flow peristaltic  
 Remarks (Color/Odor): None  
 Stabilized? yes      3 Casing Volumes Removed? NA

Screen - 3-13'gs  
 Silt Screen 6.97-14'  
 Intake - 10.5'

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
1.5	1027	6.26	0.272	35.6	0.14	8.32	0.0	5
1.5	1032	6.23	0.281	50.6	0.00	8.37	0.0	-4
1.0	1037	6.23	0.288	85.5	0.00	8.38	0.0	-6
1.5	1042	6.23	0.290	98.2	0.00	8.37	0.0	-7
2.0	1047	6.22	0.288	45.2	0.00	8.32	0.0	-8
2.5	1052	6.21	0.286	98.5	0.00	8.36	0.0	-9
<b>TEST KIT RESULTS</b>								
DO (ppm)		Fe <sup>2+</sup> (ppm)		CO <sub>2</sub> (ppm)				
NA		NA		NA				

Notes: \_\_\_\_\_

#### Well Casing Volumes

GAL/FOOT 1/4" = 0.02    1-1/4" = 0.077    2" = 0.16    3" = 0.37    4" = 0.65  
 1-1/2" = 0.10    2-1/2" = 0.24    3-1/2" = 0.50    6" = 1.46

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: Tanker Shaft      Sample Location: 04-306  
 Inspector(s): B Giles / D Balmar      Date/Time: 9/7/12 1215  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: Cloudy, misty, breezy, cold      ~50°F

### Well Data

Diameter of Well Casing: 6 in  
 Depth to Water Below Top of Casing (feet): 6.98' to  
 Total Depth of Well Below Top of Casing (feet): 13.02' to  
 Purge Method: Low flow peristaltic      Intake at 10.0' to  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 6.14' to  
 Gallons per Foot: 1.46 g      Gallons in Well: 8.96 g  
 Three Times Casing Volume: 26.9 g      Gallons Purged from Well: 3.5

### Water Sample Data

Sample Number: 04-306-2012 and 04-316-2012 (Dup)      *Screen 3-13gs  
Six Screen 6.58-13.0gs  
Intake-9.95'*  
 Time Sample Collected: 1305      1315  
 Sampling Method: Low flow peristaltic  
 Remarks (Color/Odor): None  
 Stabilized? Yes      3 Casing Volumes Removed? NA

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)
Initial	1236	6.06	0.367	0.0	0.00	8.62	0.0	22
.5	1240	6.00	0.342	0.0	0.00	8.55	0.0	10
1.0	1244	5.99	0.333	5.3	0.00	8.51	0.0	3
1.5	1248	6.00	0.328	59.2	0.00	8.55	0.0	3
2.0	1252	5.96	0.314	67.3	0.00	8.59	0.0	-1
2.5	1256	5.97	0.314	80.7	0.00	8.61	0.0	-3

## WATER SAMPLING LOG

Project Name: 2012 Adak Long-Term Monitoring      Project No.: TO 55  
 Site Name: Tanker Shed      Sample Location: 04-601  
 Inspector(s): BGiles / D Balmer      Date/Time: 9/7/12 0840  
 Company: Sealaska Environmental Services, LLC  
 Weather/Temperature: Partly cloudy, breezy, cold      ~50°F

### Well Data

Diameter of Well Casing: 2-in  
 Depth to Water Below Top of Casing (feet): 10.22'  
 Total Depth of Well Below Top of Casing (feet): 17.83' to  
 Purge Method: Low flow peristaltic      Intake at: 13.8' to  
 Calculate if well parameters do not stabilize per the work plan:  
 Length of Water Column in Well (feet): 7.61'  
 Gallons per Foot: 0.16 g      Gallons in Well: 1.22 g  
 Three Times Casing Volume: 3.65 g      Gallons Purged from Well: 4.0 g

### Water Sample Data

Sample Number: 04-601-2012  
 Time Sample Collected: 0945  
 Sampling Method: Low flow peristaltic  
 Remarks (Color/Odor): None  
 Stabilized? No      3 Casing Volumes Removed? Yes

Screen - 4.5 - 14.5'gs  
 "      7.5 - 17.5' to  
 Sub Screen - 10.2 - 17.5' +  
 Intake - 13.8' to

Purge Vol. (gallons)	Time (min)	pH (pH units)	Cond. (mS/cm)	Turbidity (NTU)	DO (mg/L)	Temp (C)	Salinity (%)	Redox (mv)

overview by Brian, discussion  
of waste management activities  
by Andy. Watch UXO video.
- 1130 Get fuel for all vehicles,  
drive to Bering Hill, and  
medical clinic
- 1345 Island tour, visit sites
- 1630 Set up QC office
- 2230 Finish for day

Sherri L Wunderlich 8/24/12

TO SS Adak LTM 8/25/12

0900 Meeting held at 111B Attendees include Sherri, Don, Brian, John & Andy (Bob has day off). Andy discusses field tasks & procedures, Brian gives safety & health briefing, Sherri discusses QC for field work. Mock road map <sup>of activity</sup> is handed out & discussed.

1100 Organize & inventory sample containers & supplies from lab. A couple supplies/bottles are not present including 7 coolers (43 of 50 requested coolers received), 4 x 500ml amber glass w/ teflon liner (for TCLP VOCs) vial (lab inadvertently sent preserved bottles), 4 <sup>trip</sup> blank vials (46 of 50 received). One methanol trip blank leaked & is unusable. (sufficient trip blank jars are available.) (Leak contained.) A few jars had methanol less than the marked meniscus. Sherri will order supplies that are missing & needed.

The jars presumably designated  
Sherri L Wulf 8/25/12

TO SS Adak LTM 8/25/12

1100 (cont) for BTEX/benzene in sediment were pre-labeled by the lab with analysis indicated as AK101 Sherri lined out the analysis, we will designate appropriately as Benzene by 8260C or BTEX by 8260C.

~~the 8/25/12 similarity, the trip blanks for BTEX/benzene were pre-labeled~~  
~~trip blank + 48461~~  
~~8/10/12 FM~~  
~~preservation. meth~~

& methanol  
The BTEX/benzene jars do not contain red dots, which differentiates them from the GLO jars & methanol. Additionally, the BTEX/benzene methanol has the meniscus marked in black, rather than red (as GLO does).

 1500 off for day

Thomas L. L. 8/26/12

TO SS Adak LTM 8/27/12

0700 Meeting held at 111B. Attendees include Sherril, Andy, Brian, John, Bob, Don. Andy passes out roadmaps & discusses today's activities. Brian gives safety briefing. Sherril discusses QC topics pertinent to today's tasks. 1) remind crew to read SASI while performing tasks & inform me if they suspect a discrepancy between instructions & how they intend to do the task. 2) remind crew to meet stringent stabilization criteria for well sampling, use calculator as necessary, get teammate to verify criteria is met. 3) remember to add "-2012" suffix to sample IDs. -1) discuss QC samples (Team 2 will initiate a trip blk for GREX & Field Dup & MS/MSD for select parameters at South of Runway wells) (Team 1 has no QC samples for SA 79 wells) (Team 3 is doing D/W/DTP/well inspections.

Sherril L. - 8/27/12

TO SS Adak LTM 8/27/12

0700 at South of Runway. Mtg adjourns.  
CONT

0800 Assist Team 2 generate trip blk. Observe Team 2 perform PID bump test & calibration. SASI #6 bullet 3 discusses a 2-point span calibration that is not performed. An "auto calibrate" is performed using a 1-point std. A 2-point calibration is not an option, as a second std is not on site. (CMP was released after supplies ordered & mobilized to site.) Sherril will ~~start~~ <sup>still list</sup> add to list of discrepancies/errors and discuss with Annette later. Due to office activities to follow up on, Sherril will not mobilize with crew. No vehicle available for QC, as one van is in the shop for repairs.

0830 Office work, generate C/PIC reports for 8/24/12 & 8/25/12.

1000 Check w/ Annette to see if she  
Sherril L. - 8/27/12

TO SS Adak LTM 8/27/12

1000 wants to review CPQC reports  
cont before I send them. She  
replies to send to Aaron Vernik  
& Brian Cullen and cc her.

1215 Team 2 calls & says their  
conductivity probe is malfunctioning  
(stuck at 999). QC doesn't have  
a vehicle, advises team to brace  
for lunch and pick up backup Horiba  
unit.

1400 Receive a call from Team 2.  
They are having same issue  
w/ backup Horiba. (Their first  
unit gave a "normal" reading  
when brought back for a calibration  
check. Switched to backup unit  
at that time, though.) QC  
instructs them to have Team 1  
bring their Horiba over to  
measure conductivity. This  
issue is same as last year,  
when 2 Horiba units were sent  
back & replacements sent.

14  
1345  
sw 8/27/12

Team 1 has same issue. Team  
3 Horiba gets picked up to try  
Sherris (w/wh) 8/27/12

8/27/12

1300 Order placed for additional bottles  
sw 8/27/12 <sup>cpa</sup> <sup>units</sup> <sup>to</sup> <sup>be</sup> <sup>needed</sup>  
that will be needed

1505 John H stops by & asks if  
product needs to be removed  
in a well <sup>at product</sup> scheduled for  
inspection but not sample collection.  
Inform John not to remove  
product but will verify  
w/ Annette

1513 Brian G calls to report that  
Team 3 Horiba appears to be  
reading conductivity correctly

1530 Andy reports that Team 1 &  
Team 3 Horibas are reading  
correctly & consistent w/ one  
another (initial reading from  
Team 1 was inaccurate but  
perhaps hadn't equilibrated.)  
Update Annette via phone.

1635 Annette returns email that specifies  
the same criteria for product  
removal applies, whether or not  
a well is scheduled for sample  
collection or not. Sherris relays  
info to John, will discuss tomorrow morning

Sherris (w/wh) 8/27/12

TO SS Adak LTM 8/27/12

1700 Collect field forms & logbooks (Teams 1 & 3) when teams return from field. Review tomorrow's roadmaps before handing off tomorrow. Discuss Haribas with Andy, who called TRS for trouble-shooting. Backup Hariba & Hariba for Team #2 will be shipped back to TRS when replacements arrive.

2030 Review Team 1 & 3 logbooks. Download photos from all teams. Team 3 photos include date but not time. Will discuss w/ Annette & notify Team 3 to reset camera with format consistent w/ other teams (eg. 08/27/2012 2030). Will give feedback to Team 3 to fix mistakes on forms & logbook with single line-out, initial & date. Will instruct Team 3 to add commentary re missing time stamp & times on tile off by 1 hour from actual time taken. Will ask teams to add unit of

Okenn Lw-ell

TO SS Adak LTM 8/27/12

2030 measure to well inspection forms  
GWT (PID reading in ppm, depth in feet)

2359 off for day

Okenn Lw-ell 8/27/12

TO SS Adak LTM 8/28/12

0700 meeting held at 111B. Attendees include Sherri, Bub, Andy, Dan, Brian, John. Andy passes out roadmaps & discusses today's activities. Brian gives safety briefing. Sherri discusses the following AC topics.

- 1) same criteria applies for product removal, whether sampling or not
  - 2" well - remove product if 7.5'
  - 24" well - " " " 7.1'

2) time stamp is missing from Team 3 photos → John indicates time stamp is present when viewing on his computer; John used his own camera - he will switch to Team 3 camera. Additionally, his camera was off by one hour (eg. camera file name would indicate 9:00 when it was actually 10:00). Camera switch will resolve this as well, John noted commenting to to make re-hourly.

8/28/12 →

- 3) logbook for Team 1 indicates Mod Level D; logbook for Team 3 indicates Level D. Neither are

Sherri (which 8/28/12)

TO SS Adak LTM 8/28/12

0700 incorrect but <sup>Sherri</sup> Andy & Brian agree  
CONT: that Level D is <sup>properly in the</sup> ~~not in the~~ <sup>21w 2/28/12</sup> ~~21w 2/28/12~~ <sup>terminology</sup>

- 4) Request that teams hand back last year's forms when turning in field forms.
- 5) Correct mistakes with a single line out, initial & date.
- 6) On well inspection form, add unit of measure (e.g. 'btc) when recording values.
- 7) Logbook start date should be date of first documentation of site activity

1000 Receive email <sup>from Amette</sup> and clarification that we need to sample NMCB well 02-478 for GLO, benzene, DRO this year and not sample at 02-479.

Andy indicates there is no water present at the location in SWM 60 (892) where surface water has been previously collected. Consult w/ Amette regarding where to collect surface water & sediment samples.

Sherri (which 8/28/12)

TU 55 Adak LTM 8/28/12

1015 Annette will call Andy to discuss directly.

1400 Review tomorrow's paperwork / roadmaps; make clarification re. <sup>NMCB</sup> 02-479 & 02-478. Since limited sediment may be available at NMCB NL-05 location, adjust jar size / quantity for DR0 & GR0, as appropriate and accounting for enough material for MS/MSD.

We will try to collect the following:

GR0 (2) 4 g <sup>glass</sup> <sup>beaker</sup> glass tared, 25g sediment + 25 ml surrogate methanol (sufficient for sample, MS, MSD & backup for all)

BTEX (2) 4 g <sup>glass</sup> <sup>beaker</sup> glass tared, 25g sediment + 25 ml (non-surrogate) methanol (sufficient for sample & backup)

DR0 (3) 4 g glass canister (sufficient for MS/MSD, sample & backup). (2 will be sufficient, w/ one for analysis & one for backup)

1630 John steps by. He said his photos do not display time stamp when  
Shenna (w-dad) 8/28/12

TU 55 Adak LTM 8/28/12

1630 viewed on his computer, they only include the date stamp.

1730 Annette replies that she thinks we can photoshop the time.

2100 Dishes supplies & bottles for NMCB sediment NL-05 sampling in preparation for tomorrow.

2145 Download photos from today's activities. As requested, John switched cameras & all of today's photos have a date & time stamp. Also, John went to South of Runway 18136 area & relabeled & retook photos of RW-18136-02. Skipped field forms & COC forms. At NMCB wells NMCB-07 & NMCB-10 ~~we will not be able to sample~~ <sup>we will not be able to sample</sup> per CMP SAP specification when  $\geq 0.02'$  product is measured. We will need to remove product at NMCB-07 (4" well w/ 0.37' product).

2345 Email Annette summary of today's

2350 activities  
off for day. Shenna (w-dad) 8/28/12

TO 55 Adak LTM 8/29/12

- 0700 Meeting at 111B. Attendees include Shirri, Andy, Bob, Don, Brian & John. Roadmaps & field forms for today's activities are handed out & discussed. AC topics discussed, It's fine to use prior years DTB for calculating 3<sup>rd</sup> casing volume, if well hasn't been inspected. Our perfers will inspect/OTW per site in same day when feasible. Brian discusses safety, esp working near shoreline.
- 0730 Schedule TRS shipment of two Horibas (nonfunctioning for conductivity) via Gold Street
- 26" x 25" x 9" 15 lbs
  - 21" x 18" x 8" 10 lbs
- TRS phone # 1-800-532-3381  
 Depart Adak on Flight 161 8/30/12,  
 arrive in Anchorage at 21:44,  
 depart Anchorage on Flight 170  
 at 1:40, arrive in Seattle at 6AM,  
 depart Seattle on Flight 662 at 1215  
 on Aug 31, arrive in Ft Worth/Dallas
- Shirri L Wheeler 8/29/12

TO 55 Adak LTM 8/29/12

- 0730 For pickup by TRS Environmental  
 CONT at 19:00 on Aug 31  
 AWB # 8250 0806
- 0815 Email tracking info to James Emmons at TRS
- 0830 Generate Sampling Deviation Forms for NMCB wells NMCB-07 & NMCB-10, which have product 20.02'.  
 Send to Annette for review
- 0910 Prep to go with Team 3 (John) & sample sediment location NL-05 at NMCB  
 Activities will be recorded in Team 3 logbook.  
 Continued working w/ Team 3 for duration of day.
- 1800 Off for day

Shirri L Wheeler 8/29/12

TUSS Adak LTM 2012 8/30/12

0700 Meeting at 111B. Attendees include Sherri, Bob, Andy, Don, Brian, John. Based on yesterday's activities, a Sampling Deviation Form is necessary to document NMCB 02-818 had product thickness at 0.05' & will, therefore, not be sampled. A well inspection performed 8/28/12 indicated PID reading 2.3 ppm at well head & 0.0 in breathing zone, sheen, no product, absent sock removed. Team 1 was scheduled to sample the well on 8/29/12 but measured product at 0.05' reading was confirmed by Team 2's interface probe.

Roamaps were handed out & today's activities discussed. Brian discusses safety. Sherri discusses QC items. Today is shipping day, we will have ~13 coolers. Sherri will make Gustavak reservation.

0830 Call to make Goldbluck reservation for shipping coolers to lab.  
AW # 8259 4993, 13 pcs 800 pounds will arrive in Portland 8/31/12 5:30.

Sherri Linder 8/30/12

TUSS Adak LTM 2012 8/30/12

0840 Review COC forms vs Revised CMP Tables 4-2, 4-3 & 5-5. Resolve/add clarifying remarks as necessary. Discuss w/ sampling crew as appropriate. Paperwork - get roamaps for Tanker Shed, SA 79 & SWMU 61 ready for handing out.

1200 Assist w/ sample handling & packaging, getting samples ready to ship. Inspect coolers.

1435 Send email to lab to alert them that 12 coolers will arrive tomorrow, available for pickup at Portland PDX.

1500 Generate Sampling Deviation form for NMCB 02-818, can't sample due to PT 20.02. Send via email to Annette for review.

1600 Andy is reviewing roamaps before handing out to teams; Bob casuals. Discrepancy is noted, reading & Revised CMP Table 4-2 indicate collection of sample is needed at SWMU 58 well 611. However,

Sherri Linder 8/30/12

TO 55 Adak LTM 2012 8/30/12

1600 2011 GWMP, Revised CMP tables 4-1  
CONT & 4-3 indicate sampling (of DKO)  
is discontinued. QCPM concurs  
no sample is to be collected at  
this location.

1430 Don points out that the  
~~2011~~ SA 78 map included  
all roadmaps is different than  
the one in the CMP (Fig 17-7)  
in regard to shoreline inspection  
route. Unless Annette indicates  
otherwise, we will follow the  
roadmap's map, which shows  
a longer route.

1200 Off for day

Shawn Lusk 8/30/12

TO 55 Adak LTM 2012 8/31/12

0700 meeting at 111B. Attendees  
include Aaron Vornik (KPM, NAFKAW)  
Shawn, Brian, Andy, Don, Bob, John.  
Andy discusses today's activities,  
Shawn goes over QC samples.  
Brian gives safety briefing.

0800 Assist teams with trip blanks.  
Unpack, inventory & organize  
13 coolers rec'd from lab  
(-only ordered 5 when not  
all ordered supplies showed  
up, others must have been  
held up).

Received email responses from  
Annette indicating not to  
sample SWM 58 well 611,  
follow our map for SA 78  
shoreline inspection, approval  
of Sampling Deviation Form  
for NMCB 02-818.

1030 Send <sup>(email)</sup> Sampling Deviation Forms  
for NMCB wells NMCB-07,  
NMCB-10 & 02-818 to  
Aaron Vornik & Brian Cullen w/  
cc to Annette & Scott Elford.

Shawn Lusk 8/31/12

TO 55 Adec LTM 2012 8/31/12

1100 Teams reports no contamination along  
SWMU shoreline, thus, no  
NL-10 surface water or sediment  
sample will be collected

1330 Review field forms

1830 off for day

- 0845 Talk to Annette. Discuss wording for Sampling Deviation Form for Foxman Power Plant 01-151. Sherri will

Sherri (with 9/4/12)

TOSS Adak LTM 2012 9/4/12

- 0845  
cont Scan & send Annette the shoreline inspection forms completed thus far. Annette confirms we need site overview pictures.
- 0930 Receive email from Greg Sclater at lab. Shipment 2<sup>samples</sup> were received within acceptable temperatures & no bottles were broken. Lab extracted 3 samples for PAH outside holding times, 02-231-2012, 02-232-2012 & 45-1-2012.
- 1120 Scan & send shoreline inspection, sediment & surface water forms to Annette to review.
- 1230 Receive Annettes comments re forms. Pass along to Teams 1 & 2 at lunchtime (Team 3 did not perform any shoreline inspections & there were no comments re sediment collection form).
- 1330 Complete & print out Sampling Deviation forms for SWMS 12-121, SA 78 NL-10 & Former Power Plant 01-151. Will give to Aaron to review & sign.

Theresa Walsh 9/4/12

TO 55 Adak LTM 2012 9/4/12

- 1400 Catch up on CPAC reports, lab logging & receipts, field forms & photo review
- 1600 Receive field forms for today's activities. Review.
- 1900 Off for day

Theresa Walsh 9/4/12

TU 55 Adak LTM 2012 9/5/12

0700 Meeting at 111B Attendees include Brian, Don, Scott, Bob, John, Bob, Beth, Aaron, Sherril. Discussed game plan for today, go items (including shoreline inspections, missed holding times, sampling deviation forms, trip blanks), safety briefing.

0800 Prepare trip blanks for Teams 1 & 2.

0815 Aaron signs Sampling Deviation Forms (qty 3). Regarding missed holding times for PHTs, Aaron indicates he'd like to recollect (to avoid addressing questions for comments) if there is time near end of field event, no need to recollect if there is not sufficient time. Discussed CMP; Sealaska realines (from Nov 2011) did not get incorporated into Stand Alone Specific Instructions & Sealaska recommendation to switch labs (from T. America - W. Sacramento <sup>Aug 5/12</sup>) to <sup>Aug 5/12</sup> Delta/Digital was not incorporated into Marine SAP.

Sherril L. Will 9/5/12

TU 55 Adak LTM 2012 9/5/12

1000 Phone call w/ Annette. Discuss shoreline inspection forms at length. Relay to Annette that Aaron prefers re-sampling for PHTs at 3 South of Kuna-ay locations to meet holding times. Annette says to discuss w/ Don (whether PHTs only) as wells are tidally influenced. Annette says Aaron asked her if we can add collection of blue seep at Roberts Landfill (NL-14) to scope, Annette says "yes". Sherril will check to see if we have sample containers & will touch base with Aaron after he visits the location today during IC inspection.

1100 Review log-ins for Shipment #1 samples vs. official scope tables 4-3 & 5-5. The receipt info indicates pH values for DRU for some water samples were not checked during log-in.

1315 Lab indicates they don't check the pH for organics (e.g. DRU) due to

Sherril L. Will 9/5/12

TU 55 Adak LTM 2012 9/5/12

1315 the potential for contamination, they  
CONT only check inorganic nitrates. The pit  
for INO is checked prior to extraction.

1800 When asked about BTEX results;  
being tidally influenced at  
wells that Aaron prefers to  
resample for PAHs due to  
missed holding time, Don  
indicates he doesn't think  
BTEX results would be. Thus,  
no need to resample BTEX along  
with PAHs (BTEX & PAHs  
are summed to calculate  
total aqueous hydrocarbon  
[TAQH]).

2330 Send email to Annette w/ll  
update re items discussed  
earlier & today's activities.

Sharon C. Wulch 9/5/12

TU 55 Adak LTM 2012 9/6/12

0700 meeting at 111B Attendees include  
Sharon, Bob, Andy, Don, Brian,  
John, Beth, Scott & Aaron.  
Discuss activities to perform  
today - finish SWM 61 (well,  
surface water, sediment, &  
shoreline inspection, IC inspections)  
Aboard teams prepping.

0800 Leave Unit w/ IC team. Stop at  
Fuels to get escort (Bib) to Roberts  
Landfill to see blue seep (NL-14)

#### LATE ENTRY

0730 Discuss <sup>conducting an FRC and</sup> collecting a surface  
water sample at Roberts Landfill  
NL-14 (blue seep). CMP SAP  
indicates a sample will be  
collected in 2013. Aaron decides  
to wait for the scheduled  
event next year (2013).

0745 Discuss shoreline inspection forms  
w/ Aaron He indicates intent is  
to document potential sources  
of petroleum contamination due  
to Navy activities

Sharon C. Wulch 9/6/12

TO 55 Adak LTM 2012 9/6/12

- 0830 Arrive at Roberts Landfill NL-14.  
Beth documents in IC logbook & takes photos.
- 0900 Arrive at SWM Unit 61 to join Teams 1 & 2 sampling well 14-113-2012 & surface water & sediment locations NL-D-04 and NL-04. Bring bottles ~~see~~ 9/6/12
- 1100 Back to Unit # 111B Observe teams packing coolers for offsite shipment to kb.
- 1230 Call Gold Truck to reserve shipment of 4 coolers. AWB# 8167 0175.
- 1245 Inspect coolers, COCs vs GMP New labels.
- 1330 Download photos, discuss field forms for shoreline inspection & sediment collection with Bob & Scott. Will follow up re documentation of a couple items w/ Annette.
- 1700 Email lab w/ tracking info for tomorrow's orders.
- 1900 Off for day

~~Shawn C. W. 9/6/12~~

TO 55 Adak LTM 2012 9/7/12

- 0700 meeting at 111B Attendees include Beth, Sherri, Don, Brian, Scott, Andy, Bub, John. Discussed today's activities (RUICC for Team 1, Tanker Shed for Team 2). If time remaining, resample the 3 South of Runway wells that need resampled for PAHs.
- 0800 Prepare trip blanks for today's sampling. Assist teams prepping.
- 0900 Review field forms, misc office work
- 1500 Review laboratory log-ins from shipment #2
- 1630 Review field forms as teams return from today's activities

- 0700 Meeting at 111B. Attendees include Beth, Sheri, Don, Brian, John, Scott, Bob, Andy. Discuss today's activities (Team 1 at SWMU 62 Sandy Cove, Team 2 will finish South of Runway <sup>at 111B</sup> relates for PAH missed holding times & then move onto SWMU 62 Sandy Cove)
- 0800 Prepare trip blank for today's sampling
- 0830 Review field logs, photos. Assist teams as needed. Prepare CPOC reports. Generate CPOC reports
- 1800 off for day

~~\_\_\_\_\_~~

Jenni LWh 9/8/12

TOSS Adak LTM 2012 9/9/12

- 1200 Review CQC forms for Teams 1 & 2. Identify that we collected DRO but not benzene for SWMU 62 Sandy Cove MW-187-1. Will recollect for benzene (only). Make ColdStreak reservation for 6 coolers.
- 1245 AWB # 8167 6560  
Flights 161, 132, ETA 5:29 A.M.
- 1400 Take coolers to airport
- 1700 Spoke to Beth, who confirmed DID was playing at airport today. Finished generating QC Contractor Production Reports for 9/3/12 to 9/9/12.
- 1155 Sent Contractor Production QC Reports 9-15 (to cover field activities 9/3/12 to 9/9/12) to Aaron & Brian Cullen with cc to Annette & Scott
- 1159 Emailed Greg Salata to cancel original analysis of PAHs (extracted outside holding time) for South of Runway wells 02-231, 02-232 & AS-1. Wells were recollected for PAHs.
- 1159 off for day. Jenni LWh 9/9/12

TO SS ADAK LTM 2012 9/10/12

0700 Meeting at 11B. Attendees include Steve, Beth, Don, Brian, Andy, Bob & John. Discuss today's activities at SWM402, qc items, health & safety briefing.

0800 Prepare trip blanks for today & tomorrow's sampling events.

0930 Receive email from Greg Salata (ALS/CAS) that there were a few broken bottles for benzene analysis.

broken { ROICC 08-200-2012 1 of 3 VOC vials  
ROICC 08-175-2012 2 of 3 VOC vials

Replied, asking lab to analyze the samples for benzene prior to Friday 9/15. Informed them that 08-200-2012 may need diluted (based on 2009 & 2010 results, not sampled in 2011) and 08-175-2012 likely will not need diluted.

1000 Exchanged emails with lab re how to ship back unused spare DRO bottles (i.e. amber w/ HCl). They recommend flushing w/ water or, alternatively, filling with water and shipping. Pass along info to Annette.  
Shannon Walsh 9/10/12

TO SS ADAK LTM 2012 9/10/12

1400 Annette calls to discuss shipping back extra DRO bottles she sends to make a baking solution (water + baking soda), pour into container, verify pH is > 2, dump liquid down drain, ship back empty bottles, wear goggles & gloves when adding baking soda solution to bottles.  $\text{NaHCO}_3 + \text{HCl} \rightarrow \text{NaCl} + \text{H}_2\text{O} + \text{CO}_2 \uparrow$

1415 Prepare bottles for IDW CERCLA & petroleum purge water. Initiate Col Form

1520 Receive call from Don. Team 2 is at a well w/ orange plugs in water & can't stabilize after 1 1/2 hrs of purging. Three times casing volume is ~ 25 gallons. Recommend to Team 2 to purge 2 hours & then sample, per CMP Worksheet 17.

1530 Check films & photos

1900 off for day

Shannon Walsh 9/10/12

TO SS Adak LTM 2012 9/11/12

0700 Meeting at 111B Attendees include Sherril, Beth, Andy, Bob, Don, Brian & John. Today's activities include SWMU 62 wells, shoreline inspection, sediment & surface water sampling

0800 Generate trip blank for GLO & BTEX to accompany sediment sample from SWMU 62 Eagle Bay location, NL-09. Bob questions why BTEX trip blank is needed, as his road map indicates BTEX is not needed for NL-095-2012. Sherril used official Dope table 4-3, which shows BTEX is included. Check other CMP tables & TO 39 AGWMR, these indicate BTEX is necessary. Tell Bob to collect BTEX.

0930 Email Annette w/ discrepancy. Annette calls & confirms BTEX necessary at this location. Discuss shoreline inspection forms & DIBO bottles. Will generate an FCR for IDW purge water, <sup>from CERCLA 5.103</sup> as waste mgmt plan indicated 13 priority pollutant metals plus aluminum is necessary.

Theresa L. White 9/11/12

TO SS Adak LTM 2012 9/11/12

0845 Generate FCR for IDW purge water from CERCLA sites SWMUs 14 & 17 because total lead is the only <sup>total</sup> contaminant of concern for these sites. It is not necessary to analyze the sample for 12 of the other priority pollutant metals and Aluminum.

Send FCR to Annette <sup>and Andy</sup> for review. Andy for <sup>OK</sup> 9/11/12

1130 Bob inquires about location of SWMU 62 Eagle Bay surface water/sediment NL-09. Roadmap figure indicates location is south of AMW-704, but its north (per Bob) Photos from TO 39

clarify its near a marked post.

1215 Review photos & forms, generate CPAC reports

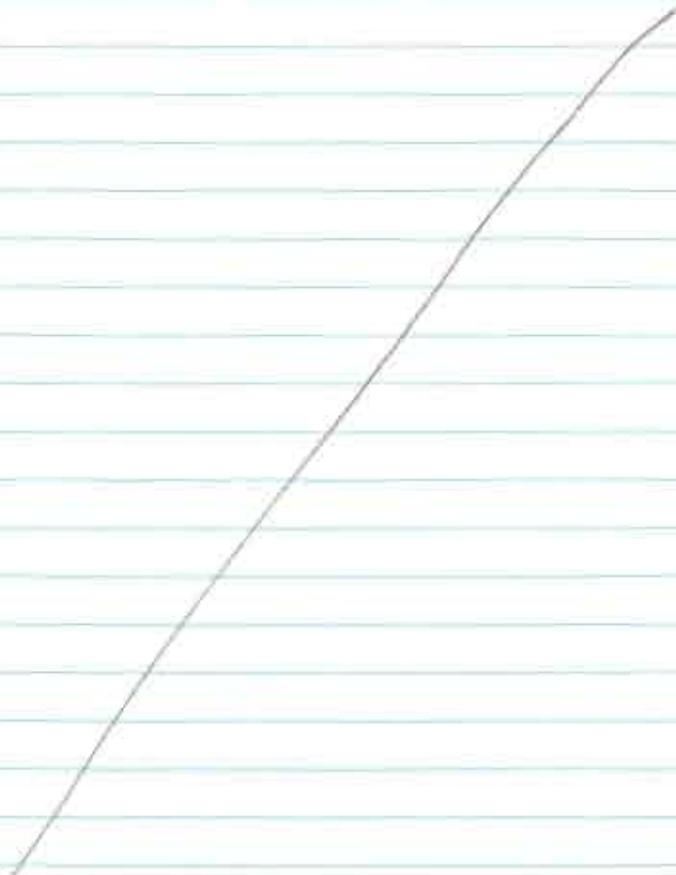

1600 Start consolidating, organizing & packing bottles in garage

1700 Inspect NL-095-2012 containers for GLO & BTEX. GLO bottles contain too much sediment. Not enough room to add

Theresa L. White 9/11/12

TO 55 Adak LTM 2012 9/11/12

1700 another vial of surrogate methanol  
 cost to bring to 1:1 ratio of sediment  
 to methanol BTEX aliquot OK  
 Will recollect for GRC only  
 2000 off for day

Shawn L Wulff 9/11/12

TO 55 Adak LTM 2012 9/10/12

0800 Meeting at IIIA. Attendees include Bob, Andy, Dan, Brian, Beth, John & Sheri. Discuss game plan for today. Includes resampling GRC aliquot for SWM4 to Eagle Bay, NL-09 sediment, neutralizing some DRO bottles (1 L amber w/ HCl) & discarding following Annette's instructions on 9/10/12 except won't dump down drain, sample petroleum & CERCLA purge water, review field forms, photos, COC forms, <sup>since</sup> packing up supplies to ship back Annette to send FCR to Aaron & Brian

0940 At bunker to neutralize DRO bottles. Activities documented in Team 3 logbook.

1100 Collect IDW-PETRO-2012

1115 Collect IDW-CERCLA-2012. Cap of TCEP VOC container fell on bunker floor & was placed on bottle. Wrote instructions <sup>on bottle label</sup> for lab to use the other 500 mL W/P amber bottle for TCEP VOCs. Bottle w/ dropped lid is pickup in case of breakage, won't be used for analysis

Shawn L Wulff

T055 Adak LTM Site Prep 8/21/12

0800 A. Lewis Calibrated 4 Hantons, 2  
infrared meters, 4 PID meters, Set 4 portable  
pumps to charge. Called TRS Environmental  
to discuss Hantons Parameter settings.

1130 A. Lewis complete

T055 Adak LTM 2012 8/24/12

0900 Onsite office meeting.  
Conducted Tailgate Health & Safety  
Topics covered:

Communications, weather/wind  
hazards, inspections, monitoring,  
required PPE (Modified Level D:  
safety glasses, nitrile gloves,  
steel toe boots, weather/rain  
gear).

Weather: 57° F. partly cloudy

1000 - Orientation and site  
overview.

1300 - Lunch

1330 - Site overview

1800 - End of day.

Robert Bond 8/24/12

T055 Adak LTM 2012 8/25/12

0900 - Onsite office meeting  
Conduct Tailgate Health & Safety  
SSHO - B. Giles

Topics covered:

Slips, trips, & falls, wind awareness,  
proper PPE (Mod level D: nitrile  
gloves, safety toe boots, &  
safety glasses).

0930 - A. Lewis coordinating  
housing issues, tow Team 2  
van to City of Adak mechanic  
shop, prep van, prep bunker, &  
prep paperwork.

1900 - End of day.

Robert Brud 8/25/12

T055 Adak LTM 2012 8/27/12

0700 - On site office meeting.  
Conduct Tailgate Health & Safety  
SSHO - B. Giles.

Topics covered:

Slips, trips, & falls, wind safety &  
awareness, proper PPE (Mod level  
D: nitrile gloves, steel toe boots,  
safety glasses)

0800 - MOB truck for sampling  
PID bump test - 99.7 ppm

0815 - Calibrate Horiba

Time	pH	SC	Turb	DO	Temp	Sal	ORP
0818	4.00	4.50	0.0	10.01	15.84	0.2	248
1215	3.99	4.49	0.0	10.09	15.21	0.2	247
1715	3.99	4.49	0.0	10.21	14.70	0.2	247

0925 - A Lewis & R. Boyd arrive  
on site 02-230 (SA 79)

0945 - Collect [DTW = 1248 ft btoe]

Set flow rate: 0.5 L/min

0947 - Collect water quality  
parameters listed on water  
sampling log.

1007 - Parameters stabilize: Purge 2.5 gal,  
pH - 6.20, SC - 0.648 mS/cm, Turb - 12 NTU,  
Temp - 7.13°C, DO - 0 mg/L, Sal - 0.0‰, ORP - -79 mV

Robert Brud 8/27/12

T055 Adak LTM 2012 8/27/12

1010 - Collect sample 02-230-2012

• 2-1 L amber w/HCl DRO (AK102)

1025 - Collect DTB = 18.93 ft btoc

Complete Monitoring Well Gauging  
Visual Inspection Checklist.

Late Entry

0935 - PID: 0.0 ppm

1035 - A. Lewis & R. Boyd on site  
MRP-MW8 (SA-79).

1040 - Collect [DTW = 11.21 ft btoc]

Set flow rate: 0.5 L/min

1052 - Collect water quality  
parameters listed on water  
sampling log.

1108 - Parameters stabilize: Purge 2.0 gal,

PH - 6.09, SC - 0.439 mS/cm, Turb - 5 NTUs, DO - 0.0 mg/L

Temp - 7.18°C, Sal - 0.0%, ORP - -71 mV

1115 - Collect sample MRP-MW8-2012

• 2-1 L amber w/HCl DRO (AK102)

1130 - Collect DTB = 16.00

1140 - Complete Monitoring Well Gauging  
Visual Inspection Checklist.

Monument lid missing, light surface rust

PID: 0.0 ppm

1200 - Lunch

Ralut Band 8/27/12

T055 Adak LTM 2012 8/27/12

1300 - A. Lewis & R. Boyd to  
City of Adak mechanic shop to  
get info on Team 2 van  
repair.

1320 - A. Lewis & R. Boyd on  
site 601 (SA 79).

Weather: 50°F, overcast, rain

1330 - Collect [DTW = 11.68 ft btoc]

Set flow rate: 0.5 L/min

1353 - Collect water quality  
parameters listed on water  
sampling log.

1405 - Parameters stabilize: Purge 1.5 gal,  
PH - 6.11, SC - 0.350 mS/cm, Turb - 3 NTUs, DO - 0.0 mg/L

Temp - 7.65°C, Sal - 0.0%, ORP - -50 mV

1415 - Collect sample 601-2012

• 2-1 L amber w/HCl DRO (AK102)

1430 - Collect DTB = 18.02 ft btoc

1440 - Complete Monitoring Well  
Gauging Visual Inspection Checklist

PID: 0.0 ppm

1450 - Photo document wells  
02-230, MRP-MW8, & 601

1500 - A. Lewis & R. Boyd on site  
02-232.

Ralut Band 8/27/12

TOSS Adak LTM 2012 8/27/12

1505 - Team 2 is having issues with SC readings on Horiba #2. SC keeps reading 0.999 mS/cm and 0.90 mS/cm, swapped Horiba #2 with back-up Horiba but same issue persists. Piggy-backed Horiba #1 & Horiba #3, & both read accurate.

1530 - Contact TRS for trouble-shooting. TRS's instructions are to press Measure to "Cond", Cal twice, push Cal (Span), up arrow to 4.49 mS/cm, press enter.

1615 - A. Lewis & R. Boyd piggy-back Horiba #2 & Back-up Horiba on Horiba #1 at 02-232 after trouble-shooting, but issue persists.

RB 15/27/12  
~~Horiba #2 (TRS #1109045) & Back-up Horiba (TRS #1109045) & Horiba #2 (TRS #1116186) will be shipped back to TRS Thursday, when 2 replacements should arrive.~~

15 RB 8/27/12

Rebut And 8/27/12

TOSS Adak LTM 2012 8/27/12

1700 - A. Lewis & B. Boyd de-mob sample van, QC paperwork, & download photos. A. Lewis & Sherri Wunderlich (QC) prepping for next day field work  
 1900 - End of work day

Rebut And 8/27/12

TOSS Adak LTM 2012 8/28/12

0630 - A. Lewis, R. Boyd begin prepping paperwork.

0700 - On site office meeting.

Conduct tailgate Health & Safety  
SSHC - B. Giles

Topics covered:

Proper PPE (Level 1): Nitrile gloves, safety glasses, safety toe boots, PFD, wind safety &amp; awareness. Slips, trips &amp; falls.

0730 - Mod sampling van

0815 - A. Lewis & B. Boyd on site  
NSWSD-7 (South of Runway 18-36).

Late Entry

0740 - Calibrate Horiba

Time	pH	SC <sup>mS/cm</sup>	Turb <sup>NTU</sup>	DO <sup>%</sup>	Temp	Sal	ORP
0740	4.00	4.49	0	10.13	15.63°C	0.2%	253mV
1400	4.00	4.50	0	10.12	16.07°C	0.2%	263mV

0825 - Collect water quality parameters: pH - 5.97, SC - 12.7 mS/cm, Turb - 7 NTU, DO - 8.41 mg/L, Temp - 13.2°C, Sal - 0.5%, ORP - 126 mV

0830 - Collect sample NSWSD-7-2012

- 3-40 mL amber VOC vials w/HCl
- BTEX 8260c

Rabun Band 8/28/12

TOSS Adak LTM 2012 8/28/12

0830 cont...

- 2 - 1 L amber w/HCl DRO AK102
- 2 - 1 L amber w/P PAHS 8270D SIM

The following documents activities performed to neutralize prepared DRO bottles (1 L amber w/ HCl)	

Mix Baking Soda and water solution ~~with~~ using ~ 7 spoonfuls of expired baking soda (exp 9/2011) and ~ 1 L tap water. Added baking soda solution to DRO water bottles (1 L amber w/ ~ 2 mL 1:1 HCl); added ~ 150 mL solution. After one bottle, tested pH to be ~ 8.0. Proceeded with procedure for ~ 15 bottles. Poured neutralized contents into plastic bucket. Measured pH at 7.64.

Discarded/discharged water to ground.

# SEALASKA ENVIRONMENTAL SERVICES

CONTRACT NUMBER: N44255-09-D-4005

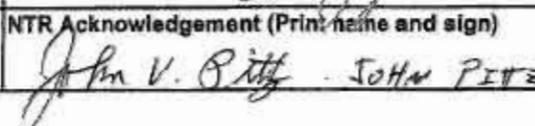

## FIELD CHANGE REQUEST (FCR)

TASK ORDER # 55      FCR # FCR-TO55-01      DATE 9/11/12  
 LOCATION: Former Naval Complex, Adak, Alaska      NTR / RPM Brian Cullen / Aaron Vernik

**1. Document to be changed. Identify revision, date, section, drawing, etc.**  
 Waste Management Plan, Annual Monitoring and Inspections, Operable Unit A, Former Naval Complex, Adak, Alaska (June 2012)

**2. Description of existing requirement and proposed change (Attach sheet if necessary)**  
 Section 2.1.3 indicates drummed purge water from wells from CERCLA sites (SWMUs 14 and 17) will be analyzed for a consortium of analytes of concern from all CERCLA sites with wells. The list of analyses includes total analysis of 13 priority pollutant metals plus aluminum by EPA Method 6020.  
 Since the only metal of concern for CERCLA sites SWMUs 14 and 17 is lead, it is not necessary to analyze for aluminum and 12 of the other priority pollutant metals. Rather, the CERCLA IDW sample will be analyzed for total lead by EPA Method 6020A (and no other total metals).

**3. Reason for Change (Attach sheet if necessary)**  
 Since the only metal of concern for CERCLA sites (SWMUs 14 and 17) is lead, it is not necessary to analyze for aluminum and 12 of the 13 priority pollutant metals. The CERCLA IDW sample will be analyzed for total lead by EPA Method 6020A (and no other total metals).

### SAMPLING DEVIATION FORM

Project Name: Annual Monitoring & Inspections Contract No.: N44255-09-D-4005  
Location: Former Naval Complex, Adak, Alaska Task No.: 55  
Site Name: NMCB Building T-1416 Expanded Area Location: NMCB-07 & NMCB-10  
Inspector(s): Brian Giles, Don Balmer, and John Highstone Date/Time: 8/28/2012 11:12 & 12:05  
Company: Sealaska Environmental Services, LLC  
Weather/Temperature: Overcast, 10 mph wind, 48° F

Material to Be Sampled:  
Groundwater

Measurement Parameter:  
Gasoline range organics, diesel range organics, benzene

Standard Procedure for Field Collection and Laboratory Analysis (cite references):  
2012 Revised Tables to Final Comprehensive Monitoring Plan, Revision 5, Appendix A, Table 4-1 page 2, Table 4-2 page 17, and Table 4-3 page 2.

Reason for Change in Field Procedure or Analytical Variation:  
Product thickness in wells NMCB-07 and NMCB-10 are 0.37 and 0.21 feet, respectively.

Variation From Field or Analytical Procedure:  
No sample was collected because product thickness was greater than or equal to 0.02 feet.

Special Equipment, Materials, or Personnel Required:

Initiator's Name: Brian Giles, Don Balmer, John Highstone Date: 8/28/12

## SAMPLING DEVIATION FORM

Project Name: Annual Monitoring & Inspections Contract No.: N44255-09-D-4005  
Location: Former Naval Complex, Adak, Alaska Task No.: 55  
Site Name: Former Power Plant, Building T-1451 Location: 01-151  
Inspector(s): Andy Lewis and Robert Boyd Date/Time: 9/01/2012 14:10  
Company: Sealaska Environmental Services, LLC  
Weather/Temperature: Overcast, wind, 51° F

Material to Be Sampled:  
Groundwater

Measurement Parameter:

Diesel range organics, benzene, toluene, ethylbenzene, xylenes, and polycyclic aromatic hydrocarbons  
Matrix spike/matrix spike duplicate for benzene, toluene, ethylbenzene, xylenes.

Standard Procedure for Field Collection and Laboratory Analysis (cite references):

2012 Revised Tables to Final Comprehensive Monitoring Plan, Revision 5, Appendix A, Table 4-1 page 1, Table 4-2 page 16, Table 4-3 page 1, and Table 5-5, page 9.

Reason for Change in Field Procedure or Analytical Variation:

Well could not be located as it has apparently been removed during recent remediation activities.

Variation From Field or Analytical Procedure:

No sample was collected because well 01-151 was not located.

A matrix spike/matrix spike duplicate for benzene, toluene, ethylbenzene, xylenes will be performed on another groundwater sample.

Special Equipment, Materials, or Personnel Required:

Notes:

\*Water levels corrected for light non-aqueous phase liquid (LNAPL) layer if observed in well. Calculation is based on the density of the type of product present. The type of product selected for the correction was determined by the 2011 analytical results. The product that was present in the highest quantities at each site or area within a site was selected. If gasoline and diesel were present in equal amounts, diesel was selected based on the assumption that the gasoline was probably weathered and denser than non-weathered gasoline.

**APPENDIX E**  
**2012 WELL MAINTENANCE AND REPAIR LIST**

**TO 55 Adak LTM 2012**  
**2011/2012 Well Maintenance and Repair List**  
**Updated August 27 - September 11, 2012**  
**Report Date: September 25, 2012**

Site	Well ID	Damage Description	Recommended Repair
Former Power Plant T-1451	01-118	Stripped bolts on monument.	Replace 9/16" flush-mount bolts.
	01-150	Cracked collar on monument.	Repair/replace monument rim/collar.
GCI Compound, UST GC-1	04-100	Cracked collar on monument.	Repair/replace monument rim/collar.
	04-204	Cracked collar on monument.	Repair/replace monument rim/collar.
	04-210	Two stripped bolts on monument.	Replace two 9/16" flush-mount bolts.
	04-211	Monument fills with water.	Repair monument.
	04-213	Stripped bolts on monument. 2-in. cap needs replacement.	Replace 9/16" flush-mount bolts and cap.
	04-701	One damaged bollard (out of four). Particulate seen throughout sampling.	Repair, install bollard. Redevelop well to remove sedimentation.
Housing Area (Arctic Acres)	03-421*	Cracked collar on monument.	Repair/replace monument rim/collar.
	03-422*	Cracked collar on monument.	Repair/replace monument rim/collar.
NMCB Building T-1416 Expanded Area	02-301	Monument lid has been replaced by an 8" non-locking J-Plug.	Replace monument lid.
	02-451	Cracked lid on monument.	Repair/replace monument lid.
	02-455	Cracked and crumbling collar on monument, lid difficult to open.	Repair/replace monument rim/collar/lid.
	02-461	Missing both 9/16" flush-mount bolts. Vault keeps filling with water.	Replace 9/16" flush-mount bolts and monument lid, reseal vault.
	02-463	Cracked collar on monument.	Repair/replace monument rim/collar.
	02-478	Missing three 9/16" flush-mount bolts.	Replace 9/16" flush-mount bolts.
	02-497	Two 9/16" flush-mount bolts broken (out of 2).	Replace 9/16" flush-mount bolts.
	02-813*	Cracked collar on monument.	Repair/replace monument rim/collar.
	02-816	Cracked collar on monument.	Repair/replace monument rim/collar.
	02-817	Broken monument collar.	Repair/replace monument rim/collar.
	02-819	Stripped bolts on monument.	Replace 9/16" flush-mount bolts.
	NMCB-04	Monument is heavily rusted, difficult to open, fills with water.	Repair monument.
	NMCB-05	Missing one (of 2) 1/2" flush-mount bolt.	Replace 1/2" flush-mount bolts.
NMCB-09	Cracked collar on monument.	Repair/replace monument rim/collar.

Site	Well ID	Damage Description	Recommended Repair
NMCB (continued)	NMCB-10	Cracked collar on monument.	Repair/replace monument rim/collar.
	NMCB-11	Cracked collar on monument.	Repair/replace monument rim/collar.
SA 78, Old Transportation Bldg.	MW-116	Monument very rusty.	Replace monument.
SA 79, Main Road Pipeline, South End	02-230	Cracked collar on monument.	Repair/replace monument rim/collar.
	MRP-MW8	Monument lid is missing, slip cap is black 2" PVC.	Repair/replace monument rim/collar.
SA 80, Steam Plant 4 (UST 27089 and 27090)	04-155	Stripped bolts (3) on monument	Replace 9/16" flush-mount bolts
	04-164	Cracked concrete base.	Repair monument base.
	04-173	Stripped bolts (2) on monument	Replace 9/16" flush-mount bolts
	SP4-2	One bolt stripped, one missing, on monument. Monument cover cracked, fills with water.	Replace 9/16" flush-mount bolts. Replace cover.
	SP4-3	Monument is heavily rusted.	Assess monument for replacement.
South of Runway 18-36 Area	02-231	Broken monument rim/collar and lid.	Replace monument rim/collar and lid.
	02-232	Cracked collar on monument.	Replace monument rim/collar.
	02-518	Cap damaged and non-locking. No well protection.	Replace cap with 2" diameter lockable type. Recommend installing bollards for well protection.
	18/36-05*	Monument collar is cracked.	Replace monument rim/collar.
	28-804*	Missing 1/2" diameter cap on casing.	Replace 1/2" diameter PVC cap.
	28-812*	Missing 1/4" diameter cap on casing.	Replace 1/4" diameter PVC cap.
	AS-1	Cover seal faulty, fills with water.	Replace monument lid/seal.
	E-208*	Monument top and lid rusted through.	Replace monument and lid.
	E-216	Top of casing is broken.	Cut off casing if J-plug won't seal.
	E-217	Cracked concrete pad.	Repair concrete pad.
	RW-18/36-04	Stripped bolts on monument.	Replace 9/16" flush-mount bolts.
	RW-18/36-06*	Bolts do not fit flush mount cover.	Replace bolts.
	Z2-4*	No lockable cap. No well protection.	Replace cap with 2" diameter lockable type. Recommend installing bollards for well protection.
	Z3-2	No lockable cap. No well protection.	Replace cap with 2" diameter lockable type. Recommend installing bollards for well protection.

SWMU 25, Roberts Landfill	A-2*	Concrete pad disintegrating.	Repair well pad.
	A-3*	Slow recharge and turbid conditions.	Redevelop well.
	A-5*	Sedimentation and turbid conditions, and well pad crumbling.	Redevelop well and repair well pad.
	B-1*	Monument lid won't lock. Casing either has surged up or the monument has sunk.	Cut off well casing or repair monument.
General Protection for Monitoring Well Network	All LTM Wells	There are a total of 161 wells, both flush-mount and stick-up, that do not have protective bollards installed. Further on-site assessment needs to be performed to determine if bollards should be installed.	Assessment would include discussions with the City, Airport, and residents. Bollard installation for wells in residential yards may not be appropriate. Flush mount in-town wells may not require bollards or bollard installation may cause interference with City and Airport functions. Remote wells may not require bollard installation.

Notes: \* indicates well was inspected in 2010/11 but not in 2012.

SUBJECT: ADAK LTM 2012, Data Validation

Dear Ms. Wunderlich,

Enclosed is the final validation report for the fractions listed below with form 1s. This SDG was received on October 19, 2012. Attachment 1 is a summary of the samples that were reviewed for each analysis.

**LDC Project # 28491:**

<b><u>SDG #</u></b>	<b><u>Fraction</u></b>
K1208651	Benzene, Gasoline Range Organics, Diesel Range Organics

The data validation was performed under EPA Level IV guidelines. The analyses were validated using the following documents, as applicable to each method:

- USEPA, Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, June 2008

Please feel free to contact us if you have any questions.

Sincerely,

Erlinda T. Rauto  
Operations Manager/Senior Chemist

## Introduction

This data review covers 4 soil samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260C for Benzene.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## **I. Technical Holding Times**

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## **II. GC/MS Instrument Performance Check**

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

## **III. Initial Calibration**

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria.

## **IV. Continuing Calibration**

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0%.

The percent differences (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## **V. Blanks**

Method blanks were reviewed for each matrix as applicable. No benzene contaminants were found in the method blanks.

Sample TB082912B was identified as a trip blank. No benzene contaminants were found.

## **VI. Surrogate Spikes**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## **VII. Matrix Spike/Matrix Spike Duplicates**

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **VIII. Laboratory Control Samples (LCS)**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

## **IX. Regional Quality Assurance and Quality Control**

Not applicable.

## **X. Internal Standards**

All internal standard areas and retention times were within QC limits.

## **XI. Target Compound Identifications**

All target compound identifications were within validation criteria.

## **XII. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **XIII. Tentatively Identified Compounds (TICs)**

Tentatively identified compounds were not reported by the laboratory.

## **XIV. System Performance**

The system performance was acceptable.

## **XV. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

## **XVI. Field Duplicates**

No field duplicates were identified in this SDG.

TB082912B  
NL-05S-2012  
NL-05S-2012MS  
NL-05S-2012MSD

## Introduction

This data review covers 4 soil samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK101 for Gasoline Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## III. Continuing Calibration

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## IV. Blanks

Method blanks were reviewed for each matrix as applicable. No gasoline range organic contaminants were found in the method blanks.

Sample TB082912B was identified as a trip blank. No gasoline range organic contaminants were found with the following exceptions:

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB082912B	8/29/12	Gasoline range organics (C6-C10)	2.2 mg/Kg	NL-05S-2012

Sample concentrations were compared to concentrations detected in the field blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated field blanks.

## V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## **VI. Matrix Spike/Matrix Spike Duplicates**

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **VII. Laboratory Control Samples**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **VIII. Target Compound Identification**

All target compound identifications were within validation criteria.

## **IX. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **X. System Performance**

The system performance was acceptable.

## **XI. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

## **XII. Field Duplicates**

No field duplicates were identified in this SDG.

## Laboratory Data Consultants, Inc. Data Validation Report

**Project/Site Name:** Adak LTM 2012  
**Collection Date:** August 29, 2012  
**LDC Report Date:** October 11, 2012  
**Matrix:** Soil  
**Parameters:** Diesel Range Organics  
**Validation Level:** EPA Level IV  
**Laboratory:** ALS Environmental  
**Sample Delivery Group (SDG):** K1208651

### Sample Identification

NL-05S-2012  
NL-05S-2012MS  
NL-05S-2012MSD

## Introduction

This data review covers 3 soil samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK102 for Diesel Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## **I. Technical Holding Times**

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## **II. Initial Calibration**

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## **III. Continuing Calibration**

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## **IV. Blanks**

Method blanks were reviewed for each matrix as applicable. No diesel range organic contaminants were found in the method blanks.

No field blanks were identified in this SDG.

## **V. Surrogate Recovery**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## **VI. Matrix Spike/Matrix Spike Duplicates**

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **VII. Laboratory Control Samples**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **VIII. Target Compound Identification**

All target compound identifications were within validation criteria.

## **IX. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **X. System Performance**

The system performance was acceptable.

## **XI. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

## **XII. Field Duplicates**

No field duplicates were identified in this SDG.

October 16, 2012

SUBJECT: ADAK LTM 2012, Data Validation

Dear Ms. Wunderlich,

Enclosed is the final validation report for the fractions listed below with form 1s. This SDG was received on October 1, 2012. Attachment 1 is a summary of the samples that were reviewed for each analysis.

**LDC Project # 28501:**

<b><u>SDG #</u></b>	<b><u>Fraction</u></b>
K1208972	Volatiles Diesel Range Organics

The data validation was performed under EPA Level IV guidelines. The analyses were validated using the following documents, as applicable to each method:

- USEPA, Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, June 2008

Please feel free to contact us if you have any questions.

Sincerely,

Erlinda T. Rauto  
Operations Manager/Senior Chemist

## Laboratory Data Consultants, Inc. Data Validation Report

**Project/Site Name:** Adak LTM 2012  
**Collection Date:** September 7, 2012  
**LDC Report Date:** October 14, 2012  
**Matrix:** Water  
**Parameters:** Volatiles  
**Validation Level:** EPA Level IV  
**Laboratory:** ALS Environmental

### Sample Identification

TB090712B  
08-202-2012  
08-200-2012  
08-175-2012

## Introduction

This data review covers 4 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260C for Volatiles which are Benzene, Toluene, Ethylbenzene and Xylenes (BTEX).

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

## III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria.

## IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0%.

The percent differences (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Sample TB090712B was identified as a trip blank. No volatile contaminants were found with the following exceptions:

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB090712B	9/7/12	Toluene	0.24 ug/L	No associated samples in this SDG

## **VI. Surrogate Spikes**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## **VII. Matrix Spike/Matrix Spike Duplicates**

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

## **VIII. Laboratory Control Samples (LCS)**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

## **IX. Regional Quality Assurance and Quality Control**

Not applicable.

## **X. Internal Standards**

All internal standard areas and retention times were within QC limits.

## **XI. Target Compound Identifications**

All target compound identifications were within validation criteria.

## **XII. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **XIII. Tentatively Identified Compounds (TICs)**

Tentatively identified compounds were not reported by the laboratory.

## **XIV. System Performance**

The system performance was acceptable.

## **XV. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

## **XVI. Field Duplicates**

No field duplicates were identified in this SDG.

03-619-2012MSD

## Introduction

This data review covers 6 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK102 for Diesel Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## **I. Technical Holding Times**

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## **II. Initial Calibration**

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## **III. Continuing Calibration**

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## **IV. Blanks**

Method blanks were reviewed for each matrix as applicable. No diesel range organic contaminants were found in the method blanks.

No field blanks were identified in this SDG.

## **V. Surrogate Recovery**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## **VI. Matrix Spike/Matrix Spike Duplicates**

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **VII. Laboratory Control Samples**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **VIII. Target Compound Identification**

All target compound identifications were within validation criteria.

## **IX. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **X. System Performance**

The system performance was acceptable.

## **XI. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

## **XII. Field Duplicates**

No field duplicates were identified in this SDG.

ATTN: Ms. Sherri Wunderlich

November 2, 2012

SUBJECT: Revised ADAK LTM 2012, Data Validation

Dear Ms. Wunderlich,

Enclosed are the revised data validation reports for the fractions listed below. Please replace the previously submitted reports with the enclosed revised reports.

**LDC Project # 28538:**

<b><u>SDG #</u></b>	<b><u>Fraction</u></b>
K1208922	Volatiles, Polynuclear Aromatic Hydrocarbons, Gasoline Range
K1209207	Organics, Diesel Range Organics

The data validation was performed under EPA Level IV guidelines. The analyses were validated using the following documents, as applicable to each method:

- USEPA, Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, June 2008

Please feel free to contact us if you have any questions.

Sincerely,

Erlinda T. Rauto  
Operations Manager/Senior Chemist

## Introduction

This data review covers 10 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260C for Volatiles which are Benzene, Toluene, Ethylbenzene and Xylenes (BTEX).

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met with the following exceptions:

Sample	Compound	Total Days From Sample Collection Until Analysis	Required Holding Time (in Days) From Sample Collection Until Analysis	Flag	A or P
14-113-2012	All TCL compounds	15	14	J (all detects) UJ (all non-detects)	A

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

## III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria.

## IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0%.

The percent differences (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Sample TB090512A was identified as a trip blank. No volatile contaminants were found with the following exceptions:

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB090512A	9/5/12	Toluene	0.26 ug/L	MW-E006-2012 653-2012 LC5A-2012 652-2012 651-2012 650-2012 14-113-2012

Sample concentrations were compared to concentrations detected in the field blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated field blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
653-2012	Toluene	0.41 ug/L	0.50U ug/L
650-2012	Toluene	0.70 ug/L	0.70U ug/L

## VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits with the following exceptions:

Sample	Surrogate	%R (Limits)	Compound	Flag	A or P
LC5A-2012	Bromofluorobenzene	57 (75-120)	All TCL compounds	J (all detects) UJ (all non-detects)	A

## VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

Spike ID (Associated Samples)	Compound	MS (%R) (Limits)	MSD (%R) (Limits)	RPD (Limits)	Flag	A or P
652-2012MS/MSD (652-2012)	Ethylbenzene	-	70 (75-125)	-	J (all detects) UJ (all non-detects)	A
	m,p-Xylenes	-	74 (75-130)	-	J (all detects) UJ (all non-detects)	

### VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

### IX. Regional Quality Assurance and Quality Control

Not applicable.

### X. Internal Standards

All internal standard areas and retention times were within QC limits.

### XI. Target Compound Identifications

All target compound identifications were within validation criteria.

### XII. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

### XIII. Tentatively Identified Compounds (TICs)

Tentatively identified compounds were not reported by the laboratory.

### XIV. System Performance

The system performance was acceptable.

### XV. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

### XVI. Field Duplicates

No field duplicates were identified in this SDG.

**Adak LTM 2012  
Volatiles - Data Qualification Summary - SDG K1208922**

SDG	Sample	Compound	Flag	A or P	Reason

652-2012  
651-2012  
650-2012  
14-113-2012

## Introduction

This data review covers 6 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per a modification of EPA SW 846 Method 8270D using Selected Ion Monitoring (SIM) for Polynuclear Aromatic Hydrocarbons.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals. All ion abundance requirements were met.

## III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all target compounds were within validation criteria.

## IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds.

The percent difference (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## V. Blanks

Method blanks were reviewed for each matrix as applicable. No polynuclear aromatic hydrocarbon contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Extraction Date	Compound TIC (RT in minutes)	Concentration	Associated Samples
KWG1210410-5	9/10/12	Naphthalene	0.0034 ug/L	All samples in SDG K1208922

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks.

No field blanks were identified in this SDG.

#### **VI. Surrogate Spikes**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

#### **VII. Matrix Spike/Matrix Spike Duplicates**

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

#### **VIII. Laboratory Control Samples (LCS)**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

#### **IX. Regional Quality Assurance and Quality Control**

Not applicable.

#### **X. Internal Standards**

All internal standard areas and retention times were within QC limits.

#### **XI. Target Compound Identifications**

All target compound identifications were within validation criteria.

#### **XII. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

#### **XIII. Tentatively Identified Compounds (TICs)**

Tentatively identified compounds were not reported by the laboratory.

#### **XIV. System Performance**

The system performance was acceptable.

## **XV. Overall Assessment**

Data flags are summarized at the end of this report if data has been qualified.

## **XVI. Field Duplicates**

No field duplicates were identified in this SDG.

## Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK101 for Gasoline Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## III. Continuing Calibration

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## IV. Blanks

Method blanks were reviewed for each matrix as applicable. No gasoline range organic contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Analysis Date	Compound	Concentration	Associated Samples
KWG1210787-5	9/14/12	Gasoline range organics (C6-C10)	15 ug/L	All samples in SDG K1208922

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks.

Sample TB090312 was identified as a trip blank. No gasoline range organic contaminants were found.

## V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

## VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## VIII. Target Compound Identification

All target compound identifications were within validation criteria.

## IX. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

## X. System Performance

The system performance was acceptable.

## XI. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

## XII. Field Duplicates

Samples 04-100-2012 and 04-110-2012 were identified as field duplicates. No gasoline range organics were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)
	04-100-2012	04-110-2012	
Gasoline range organics (C6-C10)	3800	3600	5 (≤50)

## Introduction

This data review covers 10 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK102 for Diesel Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met with the following exceptions:

Sample	Compound	Total Days From Sample Collection Until Extraction	Required Holding Time (in Days) From Sample Collection Until Extraction	Flag	A or P
04-204-2012RE	Diesel range organics	15	14	J (all detects) UJ (all non-detects)	A

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## III. Continuing Calibration

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## IV. Blanks

Method blanks were reviewed for each matrix as applicable. No diesel range organic contaminants were found in the method blanks.

No field blanks were identified in this SDG.

## V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

## VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

LCS ID	Compound	%R (Limits)	Associated Samples	Flag	A or P
KWG1210589-3/4	Diesel range organics (C10-C25)	74 (75-125)	04-204-2012 04-213-2012 KWG1210589-5	J (all detects) UJ (all non-detects)	P

## VIII. Target Compound Identification

All target compound identifications were within validation criteria.

## IX. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

## X. System Performance

The system performance was acceptable.

## XI. Overall Assessment of Data

The overall assessment of data was acceptable. In the case where more than one result was reported for an individual sample, the least technically acceptable results were rejected as follows:

Sample	Compound	Flag	A or P
04-204-2012RE	Diesel range organics (C10-C25)	R	A

Data flags are summarized at the end of this report if data has been qualified.

## XII. Field Duplicates

No field duplicates were identified in this SDG.

NL-09-2012  
NL-09S-2012  
TB091112

## Introduction

This data review covers 2 sediment samples and 3 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260C for Volatiles which are Benzene, Toluene, Ethylbenzene and Xylenes (BTEX).

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

## III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria.

## IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0%.

The percent differences (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Samples TB091012A and TB091112 were identified as trip blanks. No volatile contaminants were found with the following exceptions:

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB091012A	9/10/12	Toluene	0.22 ug/L	MW-187-1-A-2012 NL-09-2012

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB091112	9/11/12	Toluene	1.0 mg/Kg	NL-09S-2012

Sample concentrations were compared to concentrations detected in the field blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated field blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
NL-09S-2012	Toluene	0.0070 mg/Kg	0.051U mg/Kg

## VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## VII. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

## VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

## IX. Regional Quality Assurance and Quality Control

Not applicable.

## X. Internal Standards

All internal standard areas and retention times were within QC limits.

## XI. Target Compound Identifications

All target compound identifications were within validation criteria.

## XII. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

### **XIII. Tentatively Identified Compounds (TICs)**

Tentatively identified compounds were not reported by the laboratory.

### **XIV. System Performance**

The system performance was acceptable.

### **XV. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

### **XVI. Field Duplicates**

No field duplicates were identified in this SDG.

## Introduction

This data review covers one sediment sample and one water sample listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per a modification of EPA SW 846 Method 8270D using Selected Ion Monitoring (SIM) for Polynuclear Aromatic Hydrocarbons.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## **I. Technical Holding Times**

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## **II. GC/MS Instrument Performance Check**

Instrument performance was checked at 12 hour intervals. All ion abundance requirements were met.

## **III. Initial Calibration**

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all target compounds were within validation criteria.

## **IV. Continuing Calibration**

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds.

The percent difference (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## **V. Blanks**

Method blanks were reviewed for each matrix as applicable. No polynuclear aromatic hydrocarbon contaminants were found in the method blanks.

No field blanks were identified in this SDG.

## **VI. Surrogate Spikes**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## **VII. Matrix Spike/Matrix Spike Duplicates**

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

## **VIII. Laboratory Control Samples (LCS)**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **IX. Regional Quality Assurance and Quality Control**

Not applicable.

## **X. Internal Standards**

All internal standard areas and retention times were within QC limits.

## **XI. Target Compound Identifications**

All target compound identifications were within validation criteria.

## **XII. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **XIII. Tentatively Identified Compounds (TICs)**

Tentatively identified compounds were not reported by the laboratory.

## **XIV. System Performance**

The system performance was acceptable.

## **XV. Overall Assessment**

Data flags are summarized at the end of this report if data has been qualified.

## **XVI. Field Duplicates**

No field duplicates were identified in this SDG.

## Introduction

This data review covers 2 sediment samples and 2 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK101 for Gasoline Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## III. Continuing Calibration

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## IV. Blanks

Method blanks were reviewed for each matrix as applicable. No gasoline range organic contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Analysis Date	Compound	Concentration	Associated Samples
KWG1211221-5	9/22/12	Gasoline range organics (C6-C10)	14 ug/L	All water samples in SDG K1209207

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks.

Samples TB091012A and TB091112 were identified as trip blanks. No gasoline range organic contaminants were found with the following exceptions:

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB091112	9/12/12	Gasoline range organics (C6-C10)	2.1 mg/Kg	NL-09SA-2012

Sample concentrations were compared to concentrations detected in the field blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated field blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
NL-09SA-2012	Gasoline range organics (C6-C10)	2.2 mg/Kg	4.7U mg/Kg

**V. Surrogate Recovery**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

**VI. Matrix Spike/Matrix Spike Duplicates**

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

**VII. Laboratory Control Samples**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

**VIII. Target Compound Identification**

All target compound identifications were within validation criteria.

**IX. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

**X. System Performance**

The system performance was acceptable.

**XI. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

**XII. Field Duplicates**

No field duplicates were identified in this SDG.

## Introduction

This data review covers one sediment sample and 10 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK102 for Diesel Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## **I. Technical Holding Times**

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## **II. Initial Calibration**

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## **III. Continuing Calibration**

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## **IV. Blanks**

Method blanks were reviewed for each matrix as applicable. No diesel range organic contaminants were found in the method blanks.

No field blanks were identified in this SDG.

## **V. Surrogate Recovery**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## **VI. Matrix Spike/Matrix Spike Duplicates**

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **VII. Laboratory Control Samples**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **VIII. Target Compound Identification**

All target compound identifications were within validation criteria.

## **IX. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **X. System Performance**

The system performance was acceptable.

## **XI. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

## **XII. Field Duplicates**

No field duplicates were identified in this SDG.

SUBJECT: ADAK LTM 2012, Data Validation

Dear Ms. Wunderlich,

Enclosed are the final validation reports for the fractions listed below with form 1s. These SDGs were received on October 10, 2012. Attachment 1 is a summary of the samples that were reviewed for each analysis.

**LDC Project # 28561:**

<b><u>SDG #</u></b>	<b><u>Fraction</u></b>
K1208652	Volatiles, Lead, Gasoline Range Organics, Diesel Range Organics
K1208737	

The data validation was performed under EPA Level IV guidelines. The analyses were validated using the following documents, as applicable to each method:

- USEPA, Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, June 2008
- USEPA, Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, January 2010

Please feel free to contact us if you have any questions.

Sincerely,

Erlinda T. Rauto  
Operations Manager/Senior Chemist

## Introduction

This data review covers 14 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260C for Volatiles.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## **I. Technical Holding Times**

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## **II. GC/MS Instrument Performance Check**

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

## **III. Initial Calibration**

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria.

## **IV. Continuing Calibration**

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0%.

The percent differences (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## **V. Blanks**

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Sample TB-082712 was identified as a trip blank. No volatile contaminants were found with the following exceptions:

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB-082712	8/27/12	Toluene	0.25 ug/L	02-231-2012 02-241-2012 02-232-2012 AS-1-2012 02-478-2012 NMCB-12-2012 NMCB-11-2012 02-455-2012 01-153-2012

Sample concentrations were compared to concentrations detected in the field blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated field blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
02-232-2012	Toluene	0.46 ug/L	0.50U ug/L
AS-1-2012	Toluene	1.0 ug/L	1.0U ug/L

## VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits with the following exceptions:

Sample	Surrogate	%R (Limits)	Compound	Flag	A or P
02-231-2012	Toluene-d8	121 (85-120)	Benzene Toluene o-Xylene	J (all detects) J (all detects) J (all detects)	A

## VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

## IX. Regional Quality Assurance and Quality Control

Not applicable.

## X. Internal Standards

All internal standard areas and retention times were within QC limits.

## XI. Target Compound Identifications

All target compound identifications were within validation criteria.

## XII. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

## XIII. Tentatively Identified Compounds (TICs)

Tentatively identified compounds were not reported by the laboratory.

## XIV. System Performance

The system performance was acceptable.

## XV. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

## XVI. Field Duplicates

Samples 02-231-2012 and 02-241-2012 were identified as field duplicates. No volatiles were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)
	02-231-2012	02-241-2012	
Benzene	25	26	4 (≤50)
Toluene	3.9	3.8	3 (≤50)
Ethylbenzene	70	74	6 (≤50)
m,p-Xylenes	260	280	7 (≤50)
o-Xylene	8.9	9.1	2 (≤50)

**Adak LTM 2012**  
**Volatiles - Data Qualification Summary - SDG K1208652**

SDG	Sample	Compound	Flag	A or P	Reason

## Introduction

This data review covers 8 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 6020A for Lead.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- N Presumptive evidence of presence of the constituent.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. ICPMS Tune

The mass calibration was within 0.1 AMU and the percent relative standard deviation (%RSD) was less than or equal to 5%.

## III. Calibration

An initial calibration was performed.

The frequency and analysis criteria of the initial calibration verification (ICV) and continuing calibration verification (CCV) were met.

## IV. Blanks

Method blanks were reviewed for each matrix as applicable. No Lead was found in the initial, continuing and preparation blanks with the following exceptions:

Method Blank ID	Analyte	Maximum Concentration	Associated Samples
ICB/CCB	Lead	0.009 ug/L	All samples in SDG K1208652

Data qualification by the initial, continuing and preparation blanks (ICB/CCB/PBs) was based on the maximum contaminant concentration in the ICB/CCB/PBs in the analysis of each analyte. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks.

No field blanks were identified in this SDG.

## V. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

## VI. Matrix Spike Analysis

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## VII. Duplicate Sample Analysis

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in this SDG, and therefore duplicate analyses were not performed for this SDG.

## VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

## IX. Internal Standards

All internal standard percent recoveries (%R) were within QC limits.

## X. Furnace Atomic Absorption QC

Graphite furnace atomic absorption was not utilized in this SDG.

## XI. ICP Serial Dilution

ICP serial dilution analysis was performed by the laboratory. The analysis criteria were met.

## XII. Sample Result Verification

All sample result verifications were acceptable.

## XIII. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

## XIV. Field Duplicates

Samples MW14-5-2012 and MW24-5-2012 and samples MW14-5-2012F and MW24-5-2012F were identified as field duplicates. No lead was detected in any of the samples with the following exceptions:

Analyte	Concentration (ug/L)		RPD
	MW14-5-2012	MW24-5-2012	
Lead	17.2	17.3	1

Analyte	Concentration (ug/L)		RPD
	MW14-5-2012F	MW24-5-2012F	
Lead	17.0	17.4	2

## Introduction

This data review covers 8 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK101 for Gasoline Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## III. Continuing Calibration

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## IV. Blanks

Method blanks were reviewed for each matrix as applicable. No gasoline range organic contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Analysis Date	Compound	Concentration	Associated Samples
KWG1210546-5	9/11/12	Gasoline range organics (C6-C10)	14 ug/L	All samples in SDG K1208652

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
NMCB-12-2012	Gasoline range organics (C6-C10)	70 ug/L	100U ug/L
NMCB-11-2012	Gasoline range organics (C6-C10)	17 ug/L	100U ug/L
02-455-2012	Gasoline range organics (C6-C10)	59 ug/L	100U ug/L
TB082912C	Gasoline range organics (C6-C10)	18 ug/L	100U ug/L

Sample TB082912C was identified as a trip blank. No gasoline range organic contaminants were found with the following exceptions:

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB082912C	8/29/12	Gasoline range organics (C6-C10)	18 ug/L	02-478-2012 NMCB-12-2012 NMCB-11-2012 02-455-2012 MW 14-5-2012

Sample concentrations were compared to concentrations detected in the field blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated field blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
02-478-2012	Gasoline range organics (C6-C10)	78 ug/L	100U ug/L
NMCB-12-2012	Gasoline range organics (C6-C10)	70 ug/L	100U ug/L
NMCB-11-2012	Gasoline range organics (C6-C10)	17 ug/L	100U ug/L
02-455-2012	Gasoline range organics (C6-C10)	59 ug/L	100U ug/L

## V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## VI. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## VIII. Target Compound Identification

All target compound identifications were within validation criteria.

## **IX. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **X. System Performance**

The system performance was acceptable.

## **XI. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

## **XII. Field Duplicates**

No field duplicates were identified in this SDG.

## Introduction

This data review covers 10 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK102 for Diesel Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met with the following exceptions:

Sample	Compound	Total Days From Sample Collection Until Extraction	Required Holding Time (in Days) From Sample Collection Until Extraction	Flag	A or P
02-231-2012RX 02-241-2012RX	Diesel range organics (C10-C25)	29	14	J (all detects) UJ (all non-detects)	A
02-478-2012 RX NMCB-12-2012RX NMCB-11-2012RX 02-455-2012RX	Diesel range organics (C10-C25)	27	14	J (all detects) UJ (all non-detects)	A
MW14-5-2012RX	Diesel range organics (C10-C25)	26	14	J (all detects) UJ (all non-detects)	A

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## III. Continuing Calibration

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## IV. Blanks

Method blanks were reviewed for each matrix as applicable. No diesel range organic contaminants were found in the method blanks.

No field blanks were identified in this SDG.

## V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

## VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

LCS ID (Associated Samples)	Compound	LCS %R (Limits)	LCSD %R (Limits)	RPD (Limits)	Flag	A or P
KWG1210265-5 (02-231-2012 02-241-2012 02-478-2012 NMCB-12-2012 NMCB-11-2012 02-455-2012 MW14-5-2012 KWG1210265-7)	Diesel range organics (C10-C25)	69 (75-125)	-	-	J (all detects) UJ (all non-detects)	P

## VIII. Target Compound Identification

All target compound identifications were within validation criteria.

## IX. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

## X. System Performance

The system performance was acceptable.

## XI. Overall Assessment of Data

The overall assessment of data was acceptable. In the case where more than one result was reported for an individual sample, the least technically acceptable results were rejected as follows:

Sample	Compound	Flag	A or P
02-231-2012RX 02-241-2012RX 02-478-2012RX NMCB-12-2012RX NMCB-11-2012RX 02-455-2012RX MW14-5-2012RX	Diesel range organics (C10-C25)	R	A

Data flags are summarized at the end of this report if data has been qualified.

## XII. Field Duplicates

Samples 02-231-2012 and 02-241-2012 and samples 02-231-2012RX and 02-241-2012RX were identified as field duplicates. No diesel range organics were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)
	02-231-2012	02-241-2012	
Diesel range organics (C10-C25)	5400	5700	5 (≤50)

Compound	Concentration (ug/L)		RPD (Limits)
	02-231-2012RX	02-241-2012RX	
Diesel range organics (C10-C25)	5600	5500	2 (≤50)

Data Validation Report**

**Project/Site Name:** Adak LTM 2012  
**Collection Date:** August 31 through September 1, 2012  
**LDC Report Date:** November 2, 2012  
**Matrix:** Water  
**Parameters:** Volatiles  
**Validation Level:** EPA Level IV  
**Laboratory:** ALS Environmental  
**Sample Delivery Group (SDG):** K1208737

**Sample Identification**

TB083112  
12-145-2012  
12-802-2012  
14-210-2012  
TFB-MW4B-2012

## Introduction

This data review covers 5 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260B for Volatiles which are Benzene, Toluene, Ethylbenzene and Xylenes (BTEX).

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

## III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria.

## IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
9/8/12	Toluene	20.4	TB083112 14-210-2012 TFB-MW4B-2012 KWG1210395-4	J (all detects) UJ (all non-detects)	A

The percent differences (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Sample TB083112 was identified as a trip blank. No volatile contaminants were found with the following exceptions:

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB083112	8/31/12	Toluene	0.53 ug/L	12-145-2012 12-802-2012 14-210-2012 TFB-MW4B-2012

Sample concentrations were compared to concentrations detected in the field blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated field blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
14-210-2012	Toluene	0.36 ug/L	0.50U ug/L

## VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits with the following exceptions:

Sample	Surrogate	%R (Limits)	Compound	Flag	A or P
14-210-2012	Toluene-d8	123 (85-120)	All TCL compounds	J (all detects)	P

## VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

## IX. Regional Quality Assurance and Quality Control

Not applicable.

## **X. Internal Standards**

All internal standard areas and retention times were within QC limits.

## **XI. Target Compound Identifications**

All target compound identifications were within validation criteria.

## **XII. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **XIII. Tentatively Identified Compounds (TICs)**

Tentatively identified compounds were not reported by the laboratory.

## **XIV. System Performance**

The system performance was acceptable.

## **XV. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

## **XVI. Field Duplicates**

No field duplicates were identified in this SDG.

## Introduction

This data review covers 5 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK101 for Gasoline Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## **I. Technical Holding Times**

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## **II. Initial Calibration**

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## **III. Continuing Calibration**

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 20.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 20.0% for all compounds.

## **IV. Blanks**

Method blanks were reviewed for each matrix as applicable. No gasoline range organic contaminants were found in the method blanks.

Sample TB083112 was identified as a trip blank. No gasoline range organic contaminants were found.

## **V. Surrogate Recovery**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## **VI. Matrix Spike/Matrix Spike Duplicates**

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

## **VII. Laboratory Control Samples**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **VIII. Target Compound Identification**

All target compound identifications were within validation criteria.

## **IX. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **X. System Performance**

The system performance was acceptable.

## **XI. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

## **XII. Field Duplicates**

No field duplicates were identified in this SDG.

## Introduction

This data review covers 14 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK102 for Diesel Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met with the following exceptions:

Sample	Compound	Total Days From Sample Collection Until Extraction	Required Holding Time (In Days) From Sample Collection Until Extraction	Flag	A or P
MW-116-2012RX 12-145-2012RX 12-802-2012RX	Diesel range organics (C10-C25)	25	14	J (all detects) UJ (all non-detects)	A
01-150-2012RX 01-118-2012RX 01-150-2012RX MS 01-150-2012RX MSD	Diesel range organics (C10-C25)	24	14	J (all detects) UJ (all non-detects)	A

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## III. Continuing Calibration

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## IV. Blanks

Method blanks were reviewed for each matrix as applicable. No diesel range organic contaminants were found in the method blanks.

No field blanks were identified in this SDG.

## V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## VI. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

LCS ID (Associated Samples)	Compound	LCS %R (Limits)	LCSD %R (Limits)	RPD (Limits)	Flag	A or P
KWG1210265-5 (01-150-2012 01-118-2012 01-150-2012MS 01-150-2012MSD MW-116-2012 12-145-2012 12-802-2012 KWG1210265-7)	Diesel range organics (C10-C25)	69 (75-125)	-	-	J (all detects) UJ (all non-detects)	P

## VIII. Target Compound Identification

All target compound identifications were within validation criteria.

## IX. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

## X. System Performance

The system performance was acceptable.

## XI. Overall Assessment of Data

The overall assessment of data was acceptable. In the case where more than one result was reported for an individual sample, the least technically acceptable results were rejected as follows:

Sample	Compound	Flag	A or P
MW-116-2012RX 12-145-2012RX 12-802-2012RX 01-150-2012RX 01-118-2012RX	Diesel range organics (C10-C25)	R	A

Data flags are summarized at the end of this report if data has been qualified.

## **XII. Field Duplicates**

No field duplicates were identified in this SDG.

## Laboratory Data Review Checklist

Completed by:	Linda Rauto, Bing Roura, Mark Gregg		
Title:	Project Chemist	Date:	Nov 26, 2012
CS Report Name:	28561C	Report Date:	Nov 26, 2012
Consultant Firm:	Laboratory Data Consultants, Inc.		
Laboratory Name:	Columbia Analytical Services	Laboratory Report Number:	K1209248
ADEC File Number:		ADEC RecKey Number:	

### 1. Laboratory

a. Did an ADEC CS approved laboratory receive and perform all of the submitted sample analyses?

Yes     No     NA (Please explain.)    Comments:

b. If the samples were transferred to another "network" laboratory or sub-contracted to an alternate laboratory, was the laboratory performing the analyses ADEC CS approved?

Yes     No     NA (Please explain)    Comments:

### 2. Chain of Custody (COC)

a. COC information completed, signed, and dated (including released/received by)?

Yes     No     NA (Please explain)    Comments:

b. Correct analyses requested?

Yes     No     NA (Please explain)    Comments:

### 3. Laboratory Sample Receipt Documentation

a. Sample/cooler temperature documented and within range at receipt ( $4^{\circ} \pm 2^{\circ} \text{C}$ )?

Yes     No     NA (Please explain)    Comments:

Cooler temperatures were reported at -0.9°C to 1.5°C.

b. Sample preservation acceptable - acidified waters, Methanol preserved VOC soil (GRO, BTEX, Volatile Chlorinated Solvents, etc.)?

Yes       No       NA (Please explain)      Comments:

c. Sample condition documented - broken, leaking (Methanol), zero headspace (VOC vials)?

Yes       No       NA (Please explain)      Comments:

d. If there were any discrepancies, were they documented? - For example, incorrect sample containers/preservation, sample temperature outside of acceptance range, insufficient or missing samples, etc.?

Yes       No       NA (Please explain)      Comments:

e. Data quality or usability affected? (Please explain)

Comments:

Data is usable, no temperatures were above 6°C.

#### 4. Case Narrative

a. Present and understandable?

Yes       No       NA (Please explain)      Comments:

b. Discrepancies, errors or QC failures identified by the lab?

Yes       No       NA (Please explain)      Comments:

c. Were all corrective actions documented?

Yes       No       NA (Please explain)      Comments:

d. What is the effect on data quality/usability according to the case narrative?

Comments:

Data is usable

5. Samples Results

a. Correct analyses performed/reported as requested on COC?

Yes     No     NA (Please explain)

Comments:

b. All applicable holding times met?

Yes     No     NA (Please explain)

Comments:

c. All soils reported on a dry weight basis?

Yes     No     NA (Please explain)

Comments:

All samples are water.

d. Are the reported PQLs less than the Cleanup Level or the minimum required detection level for the project?

Yes     No     NA (Please explain)

Comments:

e. Data quality or usability affected? (Please explain)

Comments:

Data is usable

6. QC Samples

a. Method Blank

i. One method blank reported per matrix, analysis and 20 samples?

Yes     No     NA (Please explain)

Comments:

Yes

ii. All method blank results less than PQL?

Yes     No     NA (Please explain)

Comments:

iii. If above PQL, what samples are affected?

Comments:

iv. Do the affected sample(s) have data flags? If so, are the data flags clearly defined?

Yes     No     NA (Please explain)    Comments:

v. Data quality or usability affected? (Please explain)    Comments:

Data is usable

b. Laboratory Control Sample/Duplicate (LCS/LCSD)

i. Organics - One LCS/LCSD reported per matrix, analysis and 20 samples? (LCS/LCSD required per AK methods, LCS required per SW846)

Yes     No     NA (Please explain)    Comments:

ii. Metals/Inorganics - One LCS and one sample duplicate reported per matrix, analysis and 20 samples?

Yes     No     NA (Please explain)    Comments:

iii. Accuracy - All percent recoveries (%R) reported and within method or laboratory limits? And project specified DQOs, if applicable. (AK Petroleum methods: AK101 60%-120%, AK102 75%-125%, AK103 60%-120%; all other analyses see the laboratory QC pages)

Yes     No     NA (Please explain)    Comments:

iv. Precision - All relative percent differences (RPD) reported and less than method or laboratory limits? And project specified DQOs, if applicable. RPD reported from LCS/LCSD, MS/DMSD, and or sample/sample duplicate. (AK Petroleum methods 20%; all other analyses see the laboratory QC pages)

Yes     No     NA (Please explain)    Comments:

v. If %R or RPD is outside of acceptable limits, what samples are affected?    Comments:

vi. Do the affected samples(s) have data flags? If so, are the data flags clearly defined?

Yes     No     NA (Please explain)    Comments:

vii. Data quality or usability affected? (Please explain)    Comments:

Data is usable

c. Surrogates - Organics Only

i. Are surrogate recoveries reported for organic analyses - field, QC and laboratory samples?

Yes     No     NA (Please explain)    Comments:

ii. Accuracy - All percent recoveries (%R) reported and within method or laboratory limits? And project specified DQOs, if applicable. (AK Petroleum methods 50-150 %R; all other analyses see the laboratory report pages)

Yes     No     NA (Please explain)    Comments:

iii. Do the sample results with failed surrogate recoveries have data flags? If so, are the data flags clearly defined?

Yes     No     NA (Please explain)    Comments:

iv. Data quality or usability affected? (Use the comment box to explain.)  
Comments:

Data is usable

d. Trip Blank - Volatile analyses only (GRO, BTEX, Volatile Chlorinated Solvents, etc.): Water and Soil

i. One trip blank reported per matrix, analysis and for each cooler containing volatile samples? (If not, enter explanation below.)

Yes     No     NA (Please explain.)    Comments:

ii. Is the cooler used to transport the trip blank and VOA samples clearly indicated on the COC? (If not, a comment explaining why must be entered below)

Yes     No     NA (Please explain.)    Comments:

iii. All results less than PQL?

Yes     No     NA (Please explain.)

Comments:

iv. If above PQL, what samples are affected?

Comments:

v. Data quality or usability affected? (Please explain.)

Comments:

Data is usable

e. Field Duplicate

i. One field duplicate submitted per matrix, analysis and 10 project samples?

Yes     No     NA (Please explain.)

Comments:

ii. Submitted blind to lab?

Yes     No     NA (Please explain.)

Comments:

iii. Precision - All relative percent differences (RPD) less than specified DQOs?  
(Recommended: 30% water, 50% soil)

$$RPD (\%) = \text{Absolute Value of: } \frac{(R_1 - R_2)}{((R_1 + R_2)/2)} \times 100$$

Where  $R_1$  = Sample Concentration

$R_2$  = Field Duplicate Concentration

Yes     No     NA (Please explain.)

Comments:

iv. Data quality or usability affected? (Use the comment box to explain why or why not.)

Yes     No     NA (Please explain.)

Comments:

f. Decontamination or Equipment Blank (if applicable)

Yes     No     NA (Please explain)

Comments:

No

i. All results less than PQL?

Yes     No     NA (Please explain)

Comments:

ii. If above PQL, what samples are affected?

Comments:

iii. Data quality or usability affected? (Please explain.)

Comments:

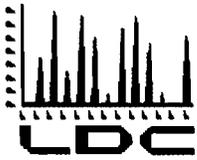

7. Other Data Flags/Qualifiers (ACOE, AFCEE, Lab Specific, etc.)

a. Defined and appropriate?

Yes     No     NA (Please explain)

Comments:

ATTN: Ms. Sherri Wunderlich

November 2, 2012

SUBJECT: Revised ADAK LTM 2012, Data Validation

Dear Ms. Wunderlich,

Enclosed are the revised data validation reports for the fractions listed below. Please replace the previously submitted reports with the enclosed revised reports.

**LDC Project # 28567:**

<b><u>SDG #</u></b>	<b><u>Fraction</u></b>
K1208915	Volatiles, Polynuclear Aromatic Hydrocarbons, Gasoline Range
K1208971	Organics, Diesel Range Organics
K1209247	

The data validation was performed under EPA Level IV guidelines. The analyses were validated using the following documents, as applicable to each method:

- USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Data Review, June 2008

Please feel free to contact us if you have any questions.

Sincerely,

Erlinda T. Rauto  
Operations Manager/Senior Chemist

## Introduction

This data review covers one soil sample, 5 sediment samples, and 5 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260C for Volatiles.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## **I. Technical Holding Times**

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## **II. GC/MS Instrument Performance Check**

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

## **III. Initial Calibration**

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria.

## **IV. Continuing Calibration**

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0%.

The percent differences (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## **V. Blanks**

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Samples TB090412 and TB090612 were identified as trip blanks. No volatile contaminants were found with the following exceptions:

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB090412	9/4/12	Toluene	0.15 ug/L	05-735-2012 05-745-2012 NL-D-04-2012 NL-04-2012
TB090612	9/6/12	Toluene	0.72 mg/Kg	NL-D-04S-2012 NL-04S-2012 NL-14S-2012

Sample concentrations were compared to concentrations detected in the field blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated field blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
NL-D-04-2012	Toluene	0.51 ug/L	0.51U ug/L
NL-D-04S-2012	Toluene	0.12 mg/Kg	0.90U mg/Kg

## VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits with the following exceptions:

Sample	Surrogate	%R (Limits)	Compound	Flag	A or P
NL-D-04S-2012	Bromofluorobenzene	81 (85-120)	All TCL compounds	J (all detects) UJ (all non-detects)	P
NL-04S-2012	Bromofluorobenzene	83 (85-120)	All TCL compounds	J (all detects) UJ (all non-detects)	P

## VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were not within QC limits. Since there were no associated samples, no data were qualified.

## VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

## IX. Regional Quality Assurance and Quality Control

Not applicable.

## X. Internal Standards

All internal standard areas and retention times were within QC limits.

## XI. Target Compound Identifications

All target compound identifications were within validation criteria.

## XII. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

## XIII. Tentatively Identified Compounds (TICs)

Tentatively identified compounds were not reported by the laboratory.

## XIV. System Performance

The system performance was acceptable.

## XV. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

## XVI. Field Duplicates

Samples 05-735-2012 and 05-745-2012 and samples NL-04S-2012 and NL-14S-2012 were identified as field duplicates. No volatiles were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)
	05-735-2012	05-745-2012	
Vinyl chloride	2.7	3.1	14 (≤50)
1,1-Dichloroethene	0.75	0.78	4 (≤50)
trans-1,2-Dichloroethene	13	14	7 (≤50)
cis-1,2-Dichloroethene	240	280	15 (≤50)
Trichloroethene	1.6	1.4	13 (≤50)

Compound	Concentration (ug/L)		RPD (Limits)
	05-735-2012	05-745-2012	
Tetrachloroethene	0.90	0.78	14 (≤50)

**Adak LTM 2012

**Laboratory Data Consultants, Inc.  
Data Validation Report**

**Project/Site Name:** Adak LTM 2012  
**Collection Date:** September 6, 2012  
**LDC Report Date:** November 2, 2012  
**Matrix:** Water  
**Parameters:** Polynuclear Aromatic Hydrocarbons  
**Validation Level:** EPA Level IV  
**Laboratory:** ALS Environmental  
**Sample Delivery Group (SDG):** K1208915

**Sample Identification**

NL-D-04-2012  
NL-04-2012

## Introduction

This data review covers 2 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per a modification of EPA SW 846 Method 8270D using Selected Ion Monitoring (SIM) for Polynuclear Aromatic Hydrocarbons.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals. All ion abundance requirements were met.

## III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all target compounds were within validation criteria.

## IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds.

The percent difference (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## V. Blanks

Method blanks were reviewed for each matrix as applicable. No semivolatile contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Extraction Date	Compound TIC (RT in minutes)	Concentration	Associated Samples
KWG1210410-5	9/10/12	Naphthalene	0.0034 ug/L	All samples in SDG K1208915

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated method blanks.

No field blanks were identified in this SDG.

#### **VI. Surrogate Spikes**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

#### **VII. Matrix Spike/Matrix Spike Duplicates**

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

#### **VIII. Laboratory Control Samples (LCS)**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

#### **IX. Regional Quality Assurance and Quality Control**

Not applicable.

#### **X. Internal Standards**

All internal standard areas and retention times were within QC limits.

#### **XI. Target Compound Identifications**

All target compound identifications were within validation criteria.

#### **XII. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

#### **XIII. Tentatively Identified Compounds (TICs)**

Tentatively identified compounds were not reported by the laboratory.

#### **XIV. System Performance**

The system performance was acceptable.

## **XV. Overall Assessment**

Data flags are summarized at the end of this report if data has been qualified.

## **XVI. Field Duplicates**

No field duplicates were identified in this SDG.

## Laboratory Data Consultants, Inc. Data Validation Report

**Project/Site Name:** Adak LTM 2012  
**Collection Date:** September 5 through September 6, 2012  
**LDC Report Date:** November 2, 2012  
**Matrix:** Soil/Sediment/Water  
**Parameters:** Gasoline Range Organics  
**Validation Level:** EPA Level IV  
**Laboratory:** ALS Environmental  
**Sample Delivery Group (SDG):** K1208915

### Sample Identification

TB090512B  
14-100-2012  
14-110-2012  
TB090612  
NL-D-04-2012

NL-04-2012  
NL-04S-2012  
NL-14S-2012

## Introduction

This data review covers one soil sample, 3 sediment samples, and 5 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK101 for Gasoline Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## III. Continuing Calibration

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## IV. Blanks

Method blanks were reviewed for each matrix as applicable. No gasoline range organic contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Analysis Date	Compound	Concentration	Associated Samples
KWG1210787-5	9/14/12	Gasoline range organics (C6-C10)	15 ug/L	TB090512B 14-100-2012 14-110-2012 NL-D-04-2012 NL-04-2012

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
NL-04-2012	Gasoline range organics (C6-C10)	15 ug/L	100U ug/L

Samples TB090512B and TB090612 were identified as trip blanks. No gasoline range organic contaminants were found with the following exceptions:

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB090612	9/6/12	Gasoline range organics (C6-C10)	2.2 mg/Kg	NL-D-04S-2012 NL-04S-2012 NL-14S-2012

Sample concentrations were compared to concentrations detected in the field blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated field blanks.

## V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

## VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## VIII. Target Compound Identification

All target compound identifications were within validation criteria.

## IX. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

## X. System Performance

The system performance was acceptable.

## XI. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

## XII. Field Duplicates

Samples NL-04S-2012 and NL-14S-2012 were identified as field duplicates. No gasoline range organics were detected in any of the samples.

## Introduction

This data review covers 8 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK102 for Diesel Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## **I. Technical Holding Times**

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## **II. Initial Calibration**

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## **III. Continuing Calibration**

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## **IV. Blanks**

Method blanks were reviewed for each matrix as applicable. No diesel range organic contaminants were found in the method blanks.

No field blanks were identified in this SDG.

## **V. Surrogate Recovery**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## **VI. Matrix Spike/Matrix Spike Duplicates**

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

## **VII. Laboratory Control Samples**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **VIII. Target Compound Identification**

All target compound identifications were within validation criteria.

## **IX. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **X. System Performance**

The system performance was acceptable.

## **XI. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

## **XII. Field Duplicates**

No field duplicates were identified in this SDG.

**Laboratory Data Consultants, Inc.  
Data Validation Report**

**Project/Site Name:** Adak LTM 2012  
**Collection Date:** September 8, 2012  
**LDC Report Date:** November 2, 2012  
**Matrix:** Water  
**Parameters:** Volatiles  
**Validation Level:** EPA Level IV  
**Laboratory:** ALS Environmental  
**Sample Delivery Group (SDG):** K1208971

**Sample Identification**

TB090812  
MRP-MW2-2012  
MRP-MW3-2012

## Introduction

This data review covers 3 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260C for Volatiles which are Benzene, Toluene, Ethylbenzene and Xylenes (BTEX).

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met with the following exceptions:

Sample	Compound	Total Days From Sample Collection Until Analysis	Required Holding Time (in Days) From Sample Collection Until Analysis	Flag	A or P
MRP-MW2-2012 MRP-MW3-2012	All TCL compounds	16	14	J (all detects) UJ (all non-detects)	A

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

## III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria.

## IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0%.

The percent differences (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Sample TB090812 was identified as a trip blank. No volatile contaminants were found with the following exceptions:

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB090812	9/8/12	Toluene	0.39 ug/L	MRP-MW2-2012 MRP-MW3-2012

Sample concentrations were compared to concentrations detected in the field blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated field blanks.

**VI. Surrogate Spikes**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits with the following exceptions:

Sample	Surrogate	%R (Limits)	Compound	Flag	A or P
TB090812	Dibromofluoromethane Toluene-d8	118 (85-115) 126 (85-120)	All TCL compounds	J (all detects)	P

**VII. Matrix Spike/Matrix Spike Duplicates**

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

**VIII. Laboratory Control Samples (LCS)**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

**IX. Regional Quality Assurance and Quality Control**

Not applicable.

**X. Internal Standards**

All internal standard areas and retention times were within QC limits.

**XI. Target Compound Identifications**

All target compound identifications were within validation criteria.

## **XII. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **XIII. Tentatively Identified Compounds (TICs)**

Tentatively identified compounds were not reported by the laboratory.

## **XIV. System Performance**

The system performance was acceptable.

## **XV. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

## **XVI. Field Duplicates**

No field duplicates were identified in this SDG.

**Collection Date:** September 7 through September 8, 2012  
**LDC Report Date:** November 2, 2012  
**Matrix:** Water  
**Parameters:** Polynuclear Aromatic Hydrocarbons  
**Validation Level:** EPA Level IV  
**Laboratory:** ALS Environmental  
**Sample Delivery Group (SDG):** K1208971

### Sample Identification

02-232R-2012  
AS-1R-2012  
02-231R-2012  
AS-1R-2012MS  
AS-1R-2012MSD

## Introduction

This data review covers 5 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per a modification of EPA SW 846 Method 8270D using Selected Ion Monitoring (SIM) for Polynuclear Aromatic Hydrocarbons.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## **I. Technical Holding Times**

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## **II. GC/MS Instrument Performance Check**

Instrument performance was checked at 12 hour intervals. All ion abundance requirements were met.

## **III. Initial Calibration**

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all target compounds were within validation criteria.

## **IV. Continuing Calibration**

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds.

The percent difference (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## **V. Blanks**

Method blanks were reviewed for each matrix as applicable. No polynuclear aromatic hydrocarbon contaminants were found in the method blanks.

No field blanks were identified in this SDG.

## **VI. Surrogate Spikes**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## **VII. Matrix Spike/Matrix Spike Duplicates**

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) were not within QC limits. Since the sample concentration was greater than the spiked concentration, no data were qualified.

## **VIII. Laboratory Control Samples (LCS)**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **IX. Regional Quality Assurance and Quality Control**

Not applicable.

## **X. Internal Standards**

All internal standard areas and retention times were within QC limits.

## **XI. Target Compound Identifications**

All target compound identifications were within validation criteria.

## **XII. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **XIII. Tentatively Identified Compounds (TICs)**

Tentatively identified compounds were not reported by the laboratory.

## **XIV. System Performance**

The system performance was acceptable.

## **XV. Overall Assessment**

Data flags are summarized at the end of this report if data has been qualified.

## **XVI. Field Duplicates**

No field duplicates were identified in this SDG.

## Laboratory Data Consultants, Inc. Data Validation Report

**Project/Site Name:** Adak LTM 2012  
**Collection Date:** September 7 through September 8, 2012  
**LDC Report Date:** November 2, 2012  
**Matrix:** Water  
**Parameters:** Gasoline Range Organics  
**Validation Level:** EPA Level IV  
**Laboratory:** ALS Environmental  
**Sample Delivery Group (SDG):** K1208971

### Sample Identification

TB090712A  
04-601-2012  
04-290-2012  
04-306-2012  
04-316-2012  
MRP-MW2-2012  
MRP-MW3-2012

## Introduction

This data review covers 7 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK101 for Gasoline Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## III. Continuing Calibration

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## IV. Blanks

Method blanks were reviewed for each matrix as applicable. No gasoline range organic contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Analysis Date	Compound	Concentration	Associated Samples
KWG1211138-5	9/21/12	Gasoline range organics (C6-C10)	18 ug/L	All samples in SDG K1208971

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks.

Sample TB090712A was identified as a trip blank. No gasoline range organic contaminants were found.

## V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## VI. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## VIII. Target Compound Identification

All target compound identifications were within validation criteria.

## IX. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

## X. System Performance

The system performance was acceptable.

## XI. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

## XII. Field Duplicates

Samples 04-306-2012 and 04-316-2012 were identified as field duplicates. No gasoline range organics were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)
	04-306-2012	04-316-2012	
Gasoline range organics (C6-C10)	670	620	8 (≤50)

## Introduction

This data review covers 7 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK102 for Diesel Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## **I. Technical Holding Times**

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## **II. Initial Calibration**

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## **III. Continuing Calibration**

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## **IV. Blanks**

Method blanks were reviewed for each matrix as applicable. No diesel range organic contaminants were found in the method blanks.

No field blanks were identified in this SDG.

## **V. Surrogate Recovery**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## **VI. Matrix Spike/Matrix Spike Duplicates**

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **VII. Laboratory Control Samples**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **VIII. Target Compound Identification**

All target compound identifications were within validation criteria.

### IX. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

### X. System Performance

The system performance was acceptable.

### XI. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

### XII. Field Duplicates

Samples 04-290-2012 and 04-300-2012 were identified as field duplicates. No diesel range organics were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)
	04-290-2012	04-300-2012	
Diesel range organics (C10-C25)	5600	5600	0 (≤50)

**Laboratory Data Consultants, Inc.  
Data Validation Report**

**Project/Site Name:** Adak LTM 2012  
**Collection Date:** September 10 through September 11, 2012  
**LDC Report Date:** November 2, 2012  
**Matrix:** Water  
**Parameters:** Volatiles  
**Validation Level:** EPA Level IV  
**Laboratory:** ALS Environmental  
**Sample Delivery Group (SDG):** K1209247

**Sample Identification**

TB091012B  
03-895-2012  
03-778-2012  
03-104-2012  
03-502-2012

## Introduction

This data review covers 5 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260C for Volatiles which are Benzene, Toluene, Ethylbenzene and Xylenes (BTEX).

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## **I. Technical Holding Times**

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## **II. GC/MS Instrument Performance Check**

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

## **III. Initial Calibration**

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria.

## **IV. Continuing Calibration**

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0%.

The percent differences (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## **V. Blanks**

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Sample TB091012B was identified as a trip blank. No volatile contaminants were found with the following exceptions:

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB091012B	9/10/12	Toluene	0.17 ug/L	03-895-2012 03-778-2012 03-104-2012 03-502-2012

Sample concentrations were compared to concentrations detected in the field blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated field blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
03-895-2012	Toluene	0.31 ug/L	0.50U ug/L
03-104-2012	Toluene	0.82 ug/L	0.82U ug/L

## VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## VII. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

## VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

## IX. Regional Quality Assurance and Quality Control

Not applicable.

## X. Internal Standards

All internal standard areas and retention times were within QC limits.

## XI. Target Compound Identifications

All target compound identifications were within validation criteria.

## **XII. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **XIII. Tentatively Identified Compounds (TICs)**

Tentatively identified compounds were not reported by the laboratory.

## **XIV. System Performance**

The system performance was acceptable.

## **XV. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

## **XVI. Field Duplicates**

No field duplicates were identified in this SDG.

## Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK101 for Gasoline Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## III. Continuing Calibration

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## IV. Blanks

Method blanks were reviewed for each matrix as applicable. No gasoline range organic contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Analysis Date	Compound	Concentration	Associated Samples
KWG1211138-5	9/21/12	Gasoline range organics (C6-C10)	18 ug/L	03-895-2012
KWG1211221-5	9/22/12	Gasoline range organics (C6-C10)	14 ug/L	TB091012B 03-778-2012 03-104-2012 03-502-2012

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
03-895-2012	Gasoline range organics (C6-C10)	18 ug/L	100U ug/L

Sample TB091012B was identified as a trip blank. No gasoline range organic contaminants were found.

## V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## VI. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

Spike ID (Associated Samples)	Compound	MS (%R) (Limits)	MSD (%R) (Limits)	RPD (Limits)	Flag	A or P
03-778-2012MS/MSD (03-778-2012)	Gasoline range organics (C6-C10)	69 (70-120)	-	-	J (all detects) UJ (all non-detects)	A

## VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## VIII. Target Compound Identification

All target compound identifications were within validation criteria.

## IX. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

## X. System Performance

The system performance was acceptable.

## XI. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

## XII. Field Duplicates

No field duplicates were identified in this SDG.

## Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK102 for Diesel Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## **I. Technical Holding Times**

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## **II. Initial Calibration**

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## **III. Continuing Calibration**

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## **IV. Blanks**

Method blanks were reviewed for each matrix as applicable. No diesel range organic contaminants were found in the method blanks.

No field blanks were identified in this SDG.

## **V. Surrogate Recovery**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## **VI. Matrix Spike/Matrix Spike Duplicates**

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

## **VII. Laboratory Control Samples**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **VIII. Target Compound Identification**

All target compound identifications were within validation criteria.

## **IX. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **X. System Performance**

The system performance was acceptable.

## **XI. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

## **XII. Field Duplicates**

No field duplicates were identified in this SDG.

SUBJECT: Revised ADAK LTM 2012, Data Validation

Dear Ms. Wunderlich,

Enclosed is the revised data validation report for the fractions listed below. Please replace the previously submitted report with the enclosed revised report.

**LDC Project # 28601:**

**SDG #**

**Fraction**

K1208738 Volatiles, Polynuclear Aromatic Hydrocarbons, Diesel Range Organics

The data validation was performed under EPA Level IV guidelines. The analyses were validated using the following documents, as applicable to each method:

- USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Data Review, June 2008

Please feel free to contact us if you have any questions.

Sincerely,

Erlinda T. Rauto  
Operations Manager/Senior Chemist

## Introduction

This data review covers 2 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260C for Volatiles.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

## III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria.

## IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
9/8/12	Toluene	20.4	All samples in SDG K1208738	J (all detects) UJ (all non-detects)	A

The percent differences (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Sample TB090112 was identified a trip blank. No volatile contaminants were found with the following exceptions:

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB090112	9/1/12	Toluene	0.21 ug/L	NL-08-2012

Sample concentrations were compared to concentrations detected in the field blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated field blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
NL-08-2012	Toluene	0.77 ug/L	0.77U ug/L

#### VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

#### VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

#### VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

#### IX. Regional Quality Assurance and Quality Control

Not applicable.

#### X. Internal Standards

All internal standard areas and retention times were within QC limits.

#### XI. Target Compound Identifications

All target compound identifications were within validation criteria.

## **XII. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **XIII. Tentatively Identified Compounds (TICs)**

Tentatively identified compounds were not reported by the laboratory.

## **XIV. System Performance**

The system performance was acceptable.

## **XV. Overall Assessment of Data**

Data flags are summarized at the end of this report if data has been qualified.

## **XVI. Field Duplicates**

No field duplicates were identified in this SDG.

NL-08S-2012MSD

## Introduction

This data review covers 3 soil samples and one water sample listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per a modification of EPA SW 846 Method 8270D using Selected Ion Monitoring (SIM) for Polynuclear Aromatic Hydrocarbons.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals. All ion abundance requirements were met.

## III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all target compounds were within validation criteria.

## IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds.

The percent difference (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## V. Blanks

Method blanks were reviewed for each matrix as applicable. No total petroleum hydrocarbons as gasoline contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Extraction Date	Compound	Concentration	Associated Samples
KWG1210256-5	9/11/12	Benzo(a)anthracene	0.0036 ug/L	All water samples in SDG K1208738

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks.

No field blanks were identified in this SDG.

#### **VI. Surrogate Spikes**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

#### **VII. Matrix Spike/Matrix Spike Duplicates**

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

#### **VIII. Laboratory Control Samples (LCS)**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

#### **IX. Regional Quality Assurance and Quality Control**

Not applicable.

#### **X. Internal Standards**

All internal standard areas and retention times were within QC limits.

#### **XI. Target Compound Identifications**

All target compound identifications were within validation criteria.

#### **XII. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

#### **XIII. Tentatively Identified Compounds (TICs)**

Tentatively identified compounds were not reported by the laboratory.

#### **XIV. System Performance**

The system performance was acceptable.

## **XV. Overall Assessment**

Data flags are summarized at the end of this report if data has been qualified.

## **XVI. Field Duplicates**

No field duplicates were identified in this SDG.

## Introduction

This data review covers one soil sample and 12 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK102 for Diesel Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met with the following exceptions:

Sample	Compound	Total Days From Sample Collection Until Extraction	Required Holding Time (in Days) From Sample Collection Until Extraction	Flag	A or P
12-114-2012RX 12-105-2012RX 12-203-2012RX	Diesel range organics (C10-C25)	25	14	J (all detects) UJ (all non-detects)	A
NL-08-2012RX NL-08-2012MSRX NL-08-2012MSDRX	Diesel range organics (C10-C25)	24	14	J (all detects) UJ (all non-detects)	A

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## III. Continuing Calibration

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## IV. Blanks

Method blanks were reviewed for each matrix as applicable. No diesel range organic contaminants were found in the method blanks.

No field blanks were identified in this SDG.

## V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## VI. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were not within QC limits. Since there were no associated samples, no data were qualified.

## VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

LCS ID (Associated Samples)	Compound	LCS %R (Limits)	LCSD %R (Limits)	RPD (Limits)	Flag	A or P
KWG1210265-5/6 (12-114-2012 12-105-2012 12-203-2012 NL-08-2012 KWG1210265-7)	Diesel range organics (C10-C25)	69 (75-125)	-	-	J (all detects) UJ (all non-detects)	P

## VIII. Target Compound Identification

All target compound identifications were within validation criteria.

## IX. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

## X. System Performance

The system performance was acceptable.

## XI. Overall Assessment of Data

The overall assessment of data was acceptable. In the case where more than one result was reported for an individual sample, the least technically acceptable results were rejected as follows:

Sample	Compound	Flag	A or P
12-114-2012RX 12-105-2012RX 12-203-2012RX NL-08-2012RX	Diesel range organics (C10-C25)	R	A

Data flags are summarized at the end of this report if data has been qualified.

## **XII. Field Duplicates**

No field duplicates were identified in this SDG.

November 12, 2012

SUBJECT: ADAK LTM 2012, Data Validation

Dear Ms. Wunderlich,

Enclosed is the final validation report for the fractions listed below with form 1s. This SDG was received on October 22, 2012. Attachment 1 is a summary of the samples that were reviewed for each analysis.

**LDC Project # 28622:**

<b><u>SDG #</u></b>	<b><u>Fraction</u></b>
K1208653	Volatiles, Polynuclear Aromatic Hydrocarbons Gasoline Range Organics, Diesel Range Organics

The data validation was performed under EPA Level IV guidelines. The analyses were validated using the following documents, as applicable to each method:

- USEPA, Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, June 2008

Please feel free to contact us if you have any questions.

Sincerely,

Erlinda T. Rauto  
Operations Manager/Senior Chemist

## Introduction

This data review covers 15 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260C for Volatiles which are Benzene, Toluene, Ethylbenzene and Xylenes (BTEX).

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## **I. Technical Holding Times**

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## **II. GC/MS Instrument Performance Check**

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

## **III. Initial Calibration**

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria.

## **IV. Continuing Calibration**

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0%.

The percent differences (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## **V. Blanks**

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Sample TB082812A was identified as a trip blank. No volatile contaminants were found with the following exceptions:

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB082812A	8/28/12	Toluene	0.18 ug/L	NSWSD-7-2012 NSWSD-17-2012 NSWSD-8-2012 852-2012 02-817-2012 02-461-2012 02-453-2012 NMCB-04-2012 02-452-2012 NMCB-08-2012 NMCB-18-2012 E-201-2012

Sample concentrations were compared to concentrations detected in the field blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated field blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
NSWSD-7-2012	Toluene	0.50 ug/L	0.50U ug/L
NSWSD-17-2012	Toluene	0.46 ug/L	0.50U ug/L
NSWSD-8-2012	Toluene	0.24 ug/L	0.50U ug/L
852-2012	Toluene	0.25 ug/L	0.50U ug/L

## VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits with the following exceptions:

Sample	Surrogate	%R (Limits)	Compound	Flag	A or P
02-817-2012	Toluene-d8	130 (85-120)	All TCL compounds	J (all detects)	P
02-461-2012	Toluene-d8	131 (85-120)	All TCL compounds	J (all detects)	P
02-453-2012	Toluene-d8	125 (85-120)	All TCL compounds	J (all detects)	P
NMCB-04-2012	Toluene-d8	128 (85-120)	All TCL compounds	J (all detects)	P
02-452-2012	Toluene-d8	130 (85-120)	All TCL compounds	J (all detects)	P

Sample	Surrogate	%R (Limits)	Compound	Flag	A or P
NMCB-08-2012	Toluene-d8	124 (85-120)	All TCL compounds	J (all detects)	P
NMCB-18-2012	Toluene-d8	124 (85-120)	All TCL compounds	J (all detects)	P
E-201-2012	Toluene-d8	136 (85-120)	All TCL compounds	J (all detects)	P

## VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

## IX. Regional Quality Assurance and Quality Control

Not applicable.

## X. Internal Standards

All internal standard areas and retention times were within QC limits.

## XI. Target Compound Identifications

All target compound identifications were within validation criteria.

## XII. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

## XIII. Tentatively Identified Compounds (TICs)

Tentatively identified compounds were not reported by the laboratory.

## XIV. System Performance

The system performance was acceptable.

## XV. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

## XVI. Field Duplicates

Samples NSWSD-7-2012 and NSWSD-17-2012 and samples NMCB-08-2012 and NMCB-18-2012 were identified as field duplicates. No volatiles were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)
	NSWSD-7-2012	NSWSD-17-2012	
Benzene	0.37	0.080	129 (≤50)
Toluene	0.50	0.46	8 (≤50)
Ethylbenzene	0.060	0.50U	200 (≤50)

Compound	Concentration (ug/L)		RPD (Limits)
	NMCB-08-2012	NMCB-18-2012	
Benzene	29	29	0 (≤50)

852-2012  
NSWSD-5S-2012MS  
NSWSD-5S-2012MSD

## Introduction

This data review covers 7 sediment samples and 4 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per a modification of EPA SW 846 Method 8270D using Selected Ion Monitoring (SIM) for Polynuclear Aromatic Hydrocarbons.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## **I. Technical Holding Times**

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## **II. GC/MS Instrument Performance Check**

Instrument performance was checked at 12 hour intervals. All ion abundance requirements were met.

## **III. Initial Calibration**

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all target compounds were within validation criteria.

## **IV. Continuing Calibration**

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds.

The percent difference (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

## **V. Blanks**

Method blanks were reviewed for each matrix as applicable. No polynuclear aromatic hydrocarbon contaminants were found in the method blanks.

No field blanks were identified in this SDG.

## **VI. Surrogate Spikes**

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## **VII. Matrix Spike/Matrix Spike Duplicates**

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **VIII. Laboratory Control Samples (LCS)**

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## **IX. Regional Quality Assurance and Quality Control**

Not applicable.

## **X. Internal Standards**

All internal standard areas and retention times were within QC limits.

## **XI. Target Compound Identifications**

All target compound identifications were within validation criteria.

## **XII. Compound Quantitation and LOQs/LODs**

All compound quantitation and LOQs/LODs were within validation criteria.

## **XIII. Tentatively Identified Compounds (TICs)**

Tentatively identified compounds were not reported by the laboratory.

## **XIV. System Performance**

The system performance was acceptable.

## **XV. Overall Assessment**

Data flags are summarized at the end of this report if data has been qualified.

## **XVI. Field Duplicates**

Samples NSWSD-7-2012 and NSWSD-17-2012 and samples NSWSD-4S-2012 and NSWSD-14S-2012 were identified as field duplicates. No polynuclear aromatic hydrocarbons were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)
	NSWSD-7-2012	NSWSD-17-2012	
Naphthalene	0.029	0.027	7 (≤50)
2-Methylnaphthalene	0.0077	0.0073	5 (≤50)

02-462-2012  
NMCB-08-2012  
E-201-2012

## Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK101 for Gasoline Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## III. Continuing Calibration

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## IV. Blanks

Method blanks were reviewed for each matrix as applicable. No gasoline range organic contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Analysis Date	Compound	Concentration	Associated Samples
KWG1210546-5	9/11/12	Gasoline range organics (C6-C10)	14 ug/L	All samples in SDG K1208653

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
TB082912A	Gasoline range organics (C6-C10)	17 ug/L	100U ug/L

Sample TB082912A was identified as a trip blank. No gasoline range organic contaminants were found with the following exceptions:

Blank ID	Sampling Date	Compound	Concentration	Associated Samples
TB082912A	8/29/12	Gasoline range organics (C6-C10)	17 ug/L	02-817-2012 02-461-2012 02-453-2012 NMCB-04-2012 02-452-2012 02-462-2012 NMCB-08-2012 E-201-2012

Sample concentrations were compared to concentrations detected in the field blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated field blanks.

#### V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

#### VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

#### VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

#### VIII. Target Compound Identification

All target compound identifications were within validation criteria.

#### IX. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

#### X. System Performance

The system performance was acceptable.

#### XI. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

## XII. Field Duplicates

Samples 02-452-2012 and 02-462-2012 were identified as field duplicates. No gasoline range organics were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)
	02-452-2012	02-462-2012	
Gasoline range organics (C6-C10)	4200	4300	2 (≤50)

## Introduction

This data review covers 5 sediment samples and 15 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per Method AK102 for Diesel Range Organics.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

- U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.
- J Indicates an estimated value.
- R Quality control indicates the data is not usable.
- NJ Presumptive evidence of presence of the compound at an estimated quantity.
- UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.
- A Indicates the finding is based upon technical validation criteria.
- P Indicates the finding is related to a protocol/contractual deviation.
- None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

## I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

## II. Initial Calibration

Initial calibration of compounds was performed as required by the method.

The percent relative standard deviations (%RSD) of calibration factors for compounds were less than or equal to 25.0%.

## III. Continuing Calibration

Calibration verification was performed at required frequencies. The percent differences (%D) of amounts in continuing standard mixtures were within the 25.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 25.0% for all compounds.

## IV. Blanks

Method blanks were reviewed for each matrix as applicable. No diesel range organic contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Extraction Date	Compound	Concentration	Associated Samples
KWG1210106-3	9/4/12	Diesel range organics (C10-C25)	11 ug/L	All water samples in SDG K1208653

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
NSWSD-7-2012	Diesel range organics (C10-C25)	38 ug/L	49U ug/L
NSWSD-17-2012	Diesel range organics (C10-C25)	35 ug/L	49U ug/L
NSWSD-8-2012	Diesel range organics (C10-C25)	34 ug/L	50U ug/L

No field blanks were identified in this SDG.

## V. Surrogate Recovery

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

## VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there was insufficient sample volume for analysis of the matrix spike and matrix spike duplicate.

## VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

## VIII. Target Compound Identification

All target compound identifications were within validation criteria.

## IX. Compound Quantitation and LOQs/LODs

All compound quantitation and LOQs/LODs were within validation criteria.

## X. System Performance

The system performance was acceptable.

## XI. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

## XII. Field Duplicates

Samples NSWSD-7-2012 and NSWSD-17-2012, samples NSWSD-2S-2012 and NSWSD-12S-2012, and samples NMCB-08-2012 and NMCB-18-2012 were identified as field duplicates. No diesel range organics were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)
	NSWSD-7-2012	NSWSD-17-2012	
Diesel range organics (C10-C25)	38	35	8 (≤50)

Compound	Concentration (mg/Kg)		RPD (Limits)
	NSWSD-2S-2012	NSWSD-12S-2012	
Diesel range organics (C10-C25)	1400	1100	24 (≤50)

Compound	Concentration (ug/L)		RPD (Limits)
	NMCB-08-2012	NMCB-18-2012	
Diesel range organics (C10-C25)	4100	3800	8 (≤50)

**Table G-1.** Relative Percent Differences between Parent Sample/Field Duplicate Pairs  
for the 2012 Groundwater Monitoring (Water Samples) (continued)

---

Bolded values represent RPD values greater than 50% criterion

*Notes:*

D = The reported result is from a diluted analysis.

DRO = diesel-range organics

GRO = gasoline-range organics

J = estimated

µg/L = micrograms per liter (parts per billion)

NC = Not calculated; one or more of the sample pair results are "U" qualified.

RPD = relative percent difference

U = Analyte not detected at specified quantitation limit.

Y = The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.

---

**Table G-2.** Relative Percent Differences between Parent Sample/Field Duplicate Pairs for the 2012 Groundwater Monitoring (Sediment Samples)

Parent Sample/Field Duplicate Location	Analyte	Parent Sample Concentration (µg/kg)	Field Duplicate Concentration (µg/kg)	RPD (%)
NL-04	Benzene	670 U	640 U	NC

There are 0 time periods with multiple data

---

A = 18

B = 0

C = 0

D = 0

E = 2

F = 0

a = 4836

b = 15444

c = 312

Group Variance = 267.667

For 80% confidence interval (two-tailed), Z at  $(1-0.8)/2 = 1.28155$

C = 20.9668

M1 =  $(78 - 20.9668)/2.0 = 28.5166$

M2 =  $(78 + 20.9668)/2.0 + 1 = 50.4834$

Lower limit is -4 = Q(29)

Upper limit is -1.6 = Q(50)

**-1.6 < 0 indicating a downward trend in data.**

**APPENDIX I**  
**PHOTOGRAPHIC LOG**

## FORMER POWER PLANT BUILDING T-1451

Photo #1: Former Power Plant Building T-1451, view west, well 01-150 with East Canal in the background.

Photo #2: Former Power Plant Building T-1451, sediment/surface water sample NL-08, view west.

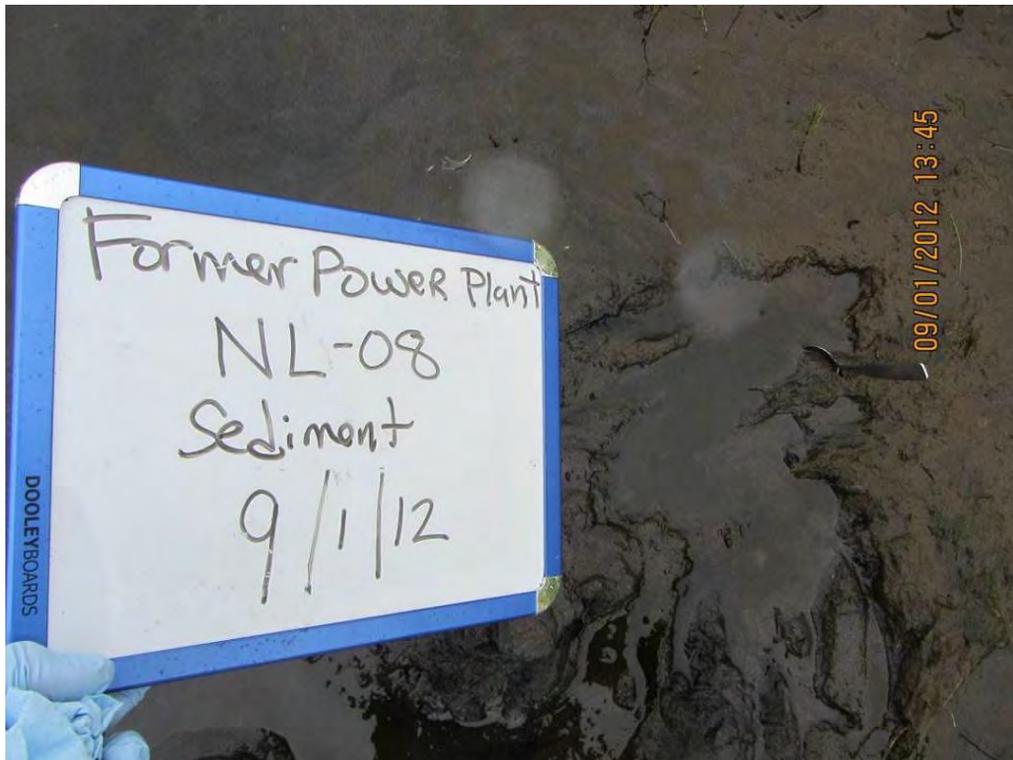

Photo #3: Former Power Plant Building T-1451, close-up view of sediment sample NL-08 location.

Photo #4: Former Power Plant Building T-1451, East Canal, start of shoreline inspection south end of Former Power Plant building in background (1 of 11 photos from south to north).

Photo #5: Former Power Plant Building T-1451, East Canal shoreline inspection heading north toward remediated shoreline seep (2 of 11 photos from south to north).

Photo #6: Former Power Plant Building T-1451, East Canal shoreline inspection heading north (3 of 11 photos from south to north).

Photo #7: Former Power Plant Building T-1451, East Canal shoreline inspection, view north (4 of 11 photos from south to north).

Photo #8: Former Power Plant Building T-1451, East Canal shoreline inspection view north (5 of 11 photos from south to north).

Photo #9: Former Power Plant Building T-1451, East Canal shoreline inspection, view north of petroleum seep at boom 11 (6 of 11 photos from south to north).

Photo #10: Former Power Plant Building T-1451, East Canal shoreline inspection, view south of boom 11 seep showing sheen and oily sediment (7 of 11 photos from south to north).

Photo #11: Former Power Plant Building T-1451, East Canal shoreline inspection, view north of boom 9/12 showing replaced shoreline (8 of 11 photos from south to north).

Photo #12: Former Power Plant Building T-1451, East Canal shoreline inspection, view north of remediated shoreline area and newly installed wells at boom 9/12 (9 of 11 photos from south to north).

Photo #13: Former Power Plant Building T-1451, East Canal shoreline inspection, view northwest of newly remediated shoreline area with newly installed wells at boom 9/12 (10 of 11 photos from south to north).

Photo #14: Former Power Plant Building T-1451, East Canal shoreline inspection, view southwest of small amount of sheen inside Boom 9/12 below remediated area (11 of 11 photos from south to north).

## GCI COMPOUND AREA

Photo #15: GCI Compound Area, view northwest.

Photo #16: GCI Compound Area, view east of well 04-100.

Photo #17: GCI Compound Area, view east of well 04-701 with damaged bollard.

### **NMCB BUILDING T-1416 EXPANDED AREA**

Photo #18: NMCB Building T-1416 Expanded Area, view west of well 02-301 with a j-plug in place of a monument lid.

Photo #19: NMCB Building T-1416 Expanded Area, view southeast of well 02-455.

Photo #20: NMCB Building T-1416 Expanded Area, view south of well 02-816.

Photo #21: NMCB Building T-1416 Expanded Area, shoreline inspection, view north from the west end of inspection adjacent to well 02-473 (1 of 22 photos west to east).

Photo #22: NMCB Building T-1416 Expanded Area, shoreline inspection, view northeast moving eastward along shoreline (2 of 22 photos west to east).

Photo #23: NMCB Building T-1416 Expanded Area, shoreline inspection, view east (3 of 22 photos west to east).

Photo #24: NMCB Building T-1416 Expanded Area, shoreline inspection, view east (4 of 22 photos west to east).

Photo #25: NMCB Building T-1416 Expanded Area, shoreline inspection, view northeast of stormwater outfall (5 of 22 photos west to east).

Photo #26: NMCB Building T-1416 Expanded Area, shoreline inspection, view east (6 of 22 photos west to east).

Photo #27: NMCB Building T-1416 Expanded Area, shoreline sediment sample NL-05, view north (7 of 22 photos west to east).

Photo #28: NMCB Building T-1416 Expanded Area, shoreline sediment sample NL-05, close-up, view north (8 of 22 photos west to east).

Photo #29: NMCB Building T-1416 Expanded Area, shoreline sediment sample NL-05, close-up, view north (9 of 22 photos west to east).

Photo #30: NMCB Building T-1416 Expanded Area, shoreline inspection, armor rock shoreline with pilings (10 of 22 photos west to east).

Photo #31: NMCB Building T-1416 Expanded Area, shoreline inspection, view east of armor rock with retaining wall in background (11 of 22 photos west to east).

Photo #32: NMCB Building T-1416 Expanded Area, shoreline inspection, view down of armor rock on shoreline (12 of 22 photos west to east).

Photo #33: NMCB Building T-1416 Expanded Area, shoreline inspection, view north up armor rock with western-most NMCB building in background (13 of 22 photos west to east).

Photo #34: NMCB Building T-1416 Expanded Area, shoreline inspection, view east closer to retaining wall (14 of 22 photos west to east).

Photo #35: NMCB Building T-1416 Expanded Area, shoreline inspection, view east of retaining wall and debris (15 of 22 photos west to east).

Photo #36: NMCB Building T-1416 Expanded Area, shoreline inspection, view east of pilings for retaining wall (16 of 22 photos west to east).

Photo #37: NMCB Building T-1416 Expanded Area, shoreline inspection, view north up shoreline toward eastern-most NMCB building (17 of 22 photos west to east).

Photo #38: NMCB Building T-1416 Expanded Area, shoreline inspection, view down from top of pilings on retaining wall (18 of 22 photos west to east).

Photo #39: NMCB Building T-1416 Expanded Area, shoreline inspection, view west-northwest looking back on retaining wall and both NMCB buildings (19 of 22 photos west to east).

Photo #40: NMCB Building T-1416 Expanded Area, shoreline inspection, view east of eastern shoreline (20 of 22 photos west to east).

Photo #41: NMCB Building T-1416 Expanded Area, shoreline inspection, view southeast of small spit east of site (21 of 22 photos west to east).

Photo #42: NMCB Building T-1416 Expanded Area, shoreline inspection, view west of small spit (22 of 22 photos west to east).

## ROICC CONTRACTORS CAMP

Photo #43: ROICC Contractors Camp, view north of well 08-175.

Photo #44: ROICC Contractors Camp, view east of well 08-200.

Photo #45: ROICC Contractors Camp, view south of well 08-202.

### **RUNWAY 5-23 AVGAS VALVE PIT**

Photo #46: Runway 5-23 Avgas Valve Pit, view northwest of well 14-100.

Photo #47: Runway 5-23 Avgas Valve Pit, view northwest of well 14-100 with flooding around well. Yakutat Hangar is in the background right.

### **SA 78, OLD TRANSPORTATION BUILDING**

Photo #48: SA 78 Old Transportation Building site, view northwest toward site and sign.

Photo #49: SA 78 Old Transportation Building, view southeast from site of well 12-119 and Clam Lagoon shoreline.

Photo #50: SA 78 Old Transportation Building, view northeast of well 12-801.

Photo #51: SA 78 Old Transportation Building, shoreline inspection view southwest downgradient of well 12-801 (1 of 8 photos east to west).

Photo #52: SA 78 Old Transportation Building, shoreline inspection view southwest further along shoreline (2 of 8 photos east to west).

Photo #53: SA 78 Old Transportation Building, shoreline inspection view north at same location as photo #49 (3 of 8 photos east to west).

Photo #54: SA 78 Old Transportation Building, shoreline inspection view southwest downgradient of well 12-802 (4 of 8 photos east to west).

Photo #55: SA 78 Old Transportation Building, shoreline inspection view southwest further down shoreline (5 of 8 photos east to west).

Photo #56: SA 78 Old Transportation Building, shoreline inspection view of biogenic sheen (6 of 8 photos east to west).

Photo #57: SA 78 Old Transportation Building, shoreline inspection view northwest at site buildings (7 of 8 photos east to west).

Photo #58: SA 78 Old Transportation Building, shoreline inspection view southwest south of site (8 of 8 photos east to west).

## SA 79, MAIN ROAD PIPELINE

Photo #59: SA 79, Main Road Pipeline site, view south.

Photo #60: SA 79, Main Road Pipeline, view southwest of well 02-230 with Sweeper Cove in background.

Photo #61: SA 79, Main Road Pipeline, view northeast of well 601 looking toward town.

Photo #62: SA 79, Main Road Pipeline, Sweeper Cove shoreline inspection, view north at southernmost starting point with well 602 in background (1 of 6 photos south to north).

Photo #63: SA 79, Main Road Pipeline, shoreline inspection, view north further north along shoreline (2 of 6 photos south to north).

Photo #64: SA 79, Main Road Pipeline, shoreline inspection, view north (3 of 6 photos south to north).

Photo #65: SA 79, Main Road Pipeline, shoreline inspection, view north downgradient of wells 02-230 and MRP-MW8 (4 of 6 photos south to north).

Photo #66: SA 79, Main Road Pipeline, shoreline inspection, view north with Main Road pipeline crossing South Sweeper Creek in background (5 of 6 photos south to north).

Photo #67: SA 79, Main Road Pipeline, shoreline inspection, view northwest at mouth of South Sweeper Creek (6 of 6 photos south to north).

### **SA 80, STEAM PLANT NO. 4**

Photo #68: SA 80, Steam Plant No. 4, view west of wells and site.

Photo #69: SA 80, Steam Plant No. 4, view east of well SP4-2 with a cracked monument lid.

### **SOUTH OF RUNWAY 18-36**

Photo #70: South of Runway 18-36, overview of product recovery trench sumps looking north.

Photo #71: South of Runway 18-36, close-up of well Z4-2.

Photo #72: South of Runway 18-36, close-up of well E-209.

Photo #73: South of Runway 18-36, view north of well 02-231 with South Sweeper Creek on left.

Photo #74: South of Runway 18-36, view of well E-217.

Photo #75: South of Runway 18-36, shoreline inspection of eastern shore of South Sweeper Creek adjacent to site, view northwest of mouth of South Sweeper Creek with Main Road Pipeline in distance (1 of 17 photos south to north).

Photo #76: South of Runway 18-36, shoreline inspection of South Sweeper Creek, view northwest towards Main Road pipeline and bridge, and boom 6 (2 of 17 photos south to north).

Photo #77: South of Runway 18-36, shoreline inspection, view northwest closer to Main Road bridge at boom 6 (3 of 17 photos south to north).

Photo #78: South of Runway 18-36, shoreline inspection of South Sweeper Creek, view northwest of shoreline under Main Road bridge, iron staining in foreground (4 of 17 photos south to north).

Photo #79: South of Runway 18-36, shoreline inspection of South Sweeper Creek, view northwest with from beneath Main Road bridge (5 of 17 photos south to north), boom 10 in background left.

Photo #80: South of Runway 18-36, shoreline inspection of South Sweeper Creek, view north toward Moffett Road bridge (6 of 17 photos south to north).

Photo #81: South of Runway 18-36, shoreline inspection of South Sweeper Creek, view north near Moffett Road bridge (7 of 17 photos south to north).

Photo #82: South of Runway 18-36, shoreline inspection of South Sweeper Creek, area of oil coated rocks approximately 4 feet by 2 feet just past Moffett Road bridge (8 of 17 photos south to north).

Photo #83: South of Runway 18-36, shoreline inspection of South Sweeper Creek, view north of Moffett Road bridge (9 of 17 photos south to north).

Photo #84: South of Runway 18-36, shoreline inspection view north of Moffett Road bridge, iron staining on shoreline in foreground (10 of 17 photos south to north).

Photo #85: South of Runway 18-36, shoreline inspection, sheen in sediment downgradient of recovery trench (11 of 17 photos south to north).

Photo #86: South of Runway 18-36, shoreline inspection north side of site, view north (12 of 17 photos south to north).

Photo #87: South of Runway 18-36, shoreline inspection, view north of bulkhead north of site (13 of 17 photos south to north).

Photo #88: South of Runway 18-36, shoreline inspection, view north from bulkhead with orange West Canal discharge pipe in distance (14 of 17 photos south to north).

Photo #89: South of Runway 18-36, shoreline inspection, view north of West Canal discharge pipes (15 of 17 photos south to north).

Photo #90: South of Runway 18-36, shoreline inspection view of petroleum sheen in the shoreline sediment north of site near trestle (16 of 17 photos south to north).

Photo #91: South of Runway 18-36, shoreline inspection, view north at end of inspection at trestle (17 of 17 photos south to north).

### **SWMU 14, OLD PESTICIDE DISPOSAL AREA**

Photo #97: SWMU 14, Old Pesticide Disposal Area, view north of monitoring well 14-5 and site overview.

### **SWMU 17, POWER PLANT NO. 3**

Photo #98: SWMU 17, Power Plant No. 3, equipment staging area, view northwest of old AST.

Photo #99: SWMU 17, Power Plant No. 3, view south of well 05-735 view north with Power Plant and crushed drums in background.

### **SWMU 58/SA 73, HEATING PLANT NO. 6**

Photo #100: SWMU 58/SA 73, Heating Plant No. 6, well 12-114 with a broken collar.

Photo #101: SWMU 58/SA 73, Heating Plant No. 6, shoreline inspection of perennial stream south end, view north with electrical pole (photo 1 of 3). Site is in background.

Photo #102: SWMU 58/SA 73, Heating Plant No. 6, shoreline inspection of perennial stream bed upstream, view south with the electrical pole in background (photo 2 of 3). No flowing water was observed in stream.

Photo #103: SWMU 58/SA 73, Heating Plant No. 6, shoreline inspection, view south at top of ravine looking toward Clam Lagoon, with 12-601(photo 3 of 3).

### **SWMU 60, TANK FARM A**

Photo #104: SWMU 60, Tank Farm A, view northeast, site overview with well 653 and Moffett Road in background. Concrete pad has heaved upward.

Photo #105: SWMU 60, Tank Farm A, downward view of well 650. Bentonite has heaved upward around casing.

Photo #106: SWMU 60, Tank Farm A, view of well 652 looking toward well 651 where worker is standing.

Photo #107: SWMU 60, Tank Farm A, view northeast of well LCSA.

Photo #108: SWMU 60, Tank Farm A, shoreline inspection of western shore of South Sweeper Creek at Main Road pipeline crossing at mouth of creek, looking northwest (1 of 12 photos south to north).

Photo #109: SWMU 60, Tank Farm A, shoreline inspection of western shore of South Sweeper Creek, view northwest beneath Main Road bridge toward boom 10 (2 of 12 photos south to north).

Photo #110: SWMU 60, Tank Farm A, shoreline inspection, view west at the south end of the inspection toward boom 10 and culvert (3 of 12 photos south to north).

Photo #111: SWMU 60, Tank Farm A, shoreline inspection, view southwest of surface water sample location 852 (4 of 12 photos south to north).

Photo #112: SWMU 60, Tank Farm A, shoreline inspection, view southwest of sediment sample location 852S (5 of 12 photos south to north).

Photo #113: SWMU 60, Tank Farm A, shoreline inspection, view north of sediment sample location 852S (6 of 12 photos south to north).

Photo #114: SWMU 60, Tank Farm A, shoreline inspection, view southwest of culvert and boom 10 with iron staining and sheen behind boom (7 of 12 photos south to north).

Photo #115: SWMU 60, Tank Farm A, shoreline inspection, petroleum seep with sheen behind boom 10 (8 of 12 photos south to north).

Photo #116: SWMU 60, Tank Farm A, shoreline inspection, view southwest of Boom 10 with oily staining (9 of 12 photos south to north).

Photo #117: SWMU 60, Tank Farm A, shoreline inspection, view northeast upstream from boom 10, during low-tide conditions (10 of 12 photos south to north).

Photo #118: SWMU 60, Tank Farm A, shoreline inspection, view west, collapsed culvert north and east of boom 10 seep (11 of 12 photos south to north).

Photo #119: SWMU 60, Tank Farm A, shoreline inspection, view north end of inspection area northeast side of lagoon (12 of 12 photos south to north).

### **SWMU 61, TANK FARM B**

Photo #120: SWMU 61, Tank Farm B, site overview, view northeast.

Photo #121: SWMU 61, Tank Farm B, looking down on North Sweeper Creek and sampling teams view northeast. Team is at surface water/sediment sample location NL-D-04.

Photo #122: SWMU 61, Tank Farm B, well 14-113 and North Sweeper Creek sample location NL-04, view east toward NORPAC Hill.

Photo #123: SWMU 61, Tank Farm B, well TFB-MW-4B view northeast toward North Sweeper Creek.

Photo #124: SWMU 61, Tank Farm B, view south of well 14-210.

Photo #125: SWMU 61, Tank Farm B, view southeast of North Sweeper Creek with surface water/sediment sample location NL-D-04, north end of shoreline inspection (1 of 5 photos north to south).

Photo #126: SWMU 61, Tank Farm B, shoreline inspection, view southeast from surface water/sediment sample location NL-D-04 (2 of 5 photos north to south).

Photo #127: SWMU 61, Tank Farm B, view northeast of surface water/sediment sample location NL-04, North Sweeper Creek (3 of 5 photos north to south).

Photo #128: SWMU 61, Tank Farm B, view northeast of sample location NL-D-04, North Sweeper Creek (4 of 5 photos north to south).

Photo #129: SWMU 61, Tank Farm B, shoreline inspection, view southeast from surface water/sediment location NL-04 toward fuel line (5 of 5 photos north to south).

### **SWMU 62, NEW HOUSING FUEL LEAK**

Photo #130: SWMU 62, New Housing Fuel Leak, Sandy Cove, view southeast.

Photo #131: SWMU 62, New Housing Fuel Leak, Sandy Cove Housing well MW-107-1.

Photo #132: SWMU 62, New Housing Fuel Leak, Eagle Bay Housing, well 03-778, view southeast.

Photo #133: SWMU 62, New Housing Fuel Leak Area, Sandy Cove Housing wells MRP-MW2 and MRP-MW-3, view southeast.

Photo #134: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, East Canal shoreline inspection, view north from north of Former Power Plant boom 9/12 (1 of 16 photos from south to north).

Photo #135: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, East Canal shoreline inspection, view south at culverts upstream of boom 9/12 (2 of 16 photos from north to south).

Photo #136: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, East Canal shoreline inspection, further north along shoreline (3 of 16 photos from north to south).

Photo #137: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, East Canal shoreline inspection, view north of high water levels (4 of 16 photos from north to south).

Photo #138: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, East Canal shoreline inspection, view north (5 of 16 from north to south).

Photo #139: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, East Canal shoreline inspection, view north toward boom 3 in distance (6 of 16 from north to south).

Photo #140: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, East Canal shoreline inspection, view north at surface water/sediment sample NL-09 and boom 3 (7 of 16 photos from north to south).

Photo #141: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, sediment sample NL-09 (8 of 16 photos from north to south).

Photo #142: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, surface water/sediment sample NL-09, location looking west (9 of 16 photos from north to south).

Photo #143: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, East Canal shoreline inspection, view north toward booms 3 and 8, downgradient from product recovery trench and seep, (10 of 16 photos from north to south).

Photo #144: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, East Canal shoreline inspection, view west of boom 3 with petroleum sheen from seep (11 of 16 photos from north to south).

Photo #145: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, East Canal shoreline inspection, view north of boom 8, shoreline petroleum seep, sheen, and oily sediments (12 of 16 photos from north to south).

Photo #146: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, East Canal shoreline inspection, view of pooled product at boom 8 (13 of 16 photos from north to south).

Photo #147: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, East Canal shoreline inspection, view of petroleum shoreline seep at boom 8 (14 of 16 photos from north to south).

Photo #148: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, East Canal shoreline inspection, view north upstream of boom 3 (15 of 16 photos from north to south).

Photo #149: SWMU 62, New Housing Fuel Leak Area, Eagle Bay Housing, East Canal shoreline inspection, view west from boom 8 to boom 2 around culverts, heavy petroleum seep, sheen, iron staining, and oily sediments, (16 of 16 photos from north to south).

### **TANKER SHED UST-42494**

Photo #150: Tanker Shed UST-42494, view west of site, well 04-175 in foreground.

Photo #151: Tanker Shed UST-42494, view north of well 04-310, broken monument and lid.

Photo #152: Tanker Shed UST-42494, close-up view of well TS-03.

## **APPENDIX J**

### **SUMMARY OF FREE PRODUCT RECOVERY AT ADAK ISLAND FORMER NAVAL COMPLEX**

Free product recovery activities were performed at some of the LTM sites during the 2011/2012 contract year. Wells were selected for free product recovery partly on the basis of the observance of a significant amount of free product during past LTM sampling events.

In September 2006, free product recovery activities resumed for select wells at three sites: South of Runway 18-36 Area; NMCB Building T-1416 Expanded Area (NMCB); and SWMU 62, New Housing Fuel Leak Area. Free product recovery activities at NMCB ceased in September 2008 because endpoint criteria were achieved. However, in June 2010 free product recovery activities at the NMCB resumed due to observance of free product in surface water protection wells at the site. In February 2012, with approval of ADEC, free product recovery was discontinued at South of Runway 18-36 Area because the practical endpoint criteria were met. A summary of the free product activities conducted at the SWMU 62, New Housing Fuel Leak area during the 2011/2012 contract year (October 2011 through September 2012) is presented in the Remedial Action Summary Report for Free Product Recovery, Adak, Alaska, November 26, 2013 (Navy 2012f).

Specific wells at additional sites were identified for free product recovery on the basis of 2010 and 2011 LTM field observations. These activities were conducted concurrently with free product recovery activities at SWMU 62, New Housing Fuel Leak Area. Free product activities were conducted at 13 additional wells located at the following four sites:

- NMCB
- SA 80, Steam Plant 4
- SWMU 58/SA 73, Heating Plant 6
- SWMU 60, Tank Farm A

Corrected groundwater elevations, product thicknesses, and volumes of recovered free product are presented in Tables J-1 through J-3 for the SWMU 62, New Housing Fuel Leak Area from October 2011 through September 2012. Tables J-4 and J-5 list the observed monthly product thicknesses and volumes of recovered product, respectively, for the wells at other sites.

**Table J-1.** Corrected Groundwater Elevation Summary from October 2011 through September 2012, SMWU 62, New Housing Fuel Leak Area

**Comments Developed: May 15, 2013**

Cmt. No.	Pg. & Line	Sec.	Comment/Recommendation	Navy Response April 22, 2013
1.	ES-2	ES	<p>Revisions will be required on some of the site specific recommendations.</p> <p>While ADEC supports reducing the LTM monitoring frequency there are a few sites where we do not yet have adequate data to switch to every other year monitoring. T-1451, Area 303, and SWMU 60-62 are sites where continued annual monitoring may be appropriate. More detail is provided as individual comments (below). ADEC understands that these sites will be discussed at our upcoming meeting to finalize future monitoring requirements.</p>	<p>During the meeting on April 17, 2013, it was agreed that annual monitoring may be required at sites Former Power Plant Building T-1451, the newly added Area 303, and SWMU 60 Tank Farm A due to the continued or past observance of contamination at these sites. However, all of these sites are currently scheduled to be monitored in August/September 2013 and the decision to continue or reduce monitoring frequency will be made based on the 2013 results.</p>
2.		Figure 2-1	<p>The area identified as “Ordnance Sites” in the legend is incorrectly identified. This is the Parcel 4 boundary. Please revise legend.</p>	<p>Change made.</p>
3.	Page 2-5	Section 2.3	<p>Please note that no sampling occurred at the landfills during the 2012 monitoring event.</p> <p>You should also document here or in the deviation section that surface water sampling at Roberts landfill was inadvertently not conducted due to incorrect recommendations being included in the final 2011 landfill report.</p>	<p>Page 2-5, line 2, added the following:  <b>“Monitoring at landfill sites did not occur during 2012 due to a reduction in the monitoring frequency but will occur in 2013 as per the CMP, Revision 5.”</b></p> <p>Page 5-1, line 22, added the following:  <b>“Groundwater monitoring activities were not performed at SWMU 25, Roberts Landfill as per the recommendations in the 2011 Landfill Monitoring Report. Surface water monitoring also was not performed at SWMU 25, Roberts Landfill due to a misunderstanding between the Navy and ADEC re the reduction of monitoring frequency. Both groundwater and surface water monitoring at SWMU 25 will be</b></p>

				<b>performed in 2013 during LTM activities as prescribed in the CMP, Revision 5.”</b>
4.	Page 2-35, Table 2-4	SWMU 15	Site closure for SWMU 15 is still pending until the PCB issue is resolved.	Table 2-2, removed asterisk from SWMU 15. Table 2-4 was changed to reflect closure is pending.
5.	Page 5, Line 10	5.0	ADEC finds it mystifying that the Navy and their contractor could not select one of the 9 new wells that were installed on site for sampling in place of 01-151. Especially in light of ADEC’s concerns regarding scheduling sampling for the new wells at this site.	Well construction information for the newly installed wells at Building T-1451 was not available during the LTM activities to appropriately select a replacement well. These newly installed wells are scheduled to be sampled during the 2013 LTM activities.
6.	Page 7-7	7.6	We just installed 9 new wells and an enhanced attenuation zone at the petroleum seep at this site. We need to evaluate appropriate monitoring requirements once we have initial characterization data for these wells. I thought more frequent monitoring in this area would be appropriate to evaluate the effectiveness of the zone....not less frequent. Please revise recommendation to evaluate monitoring requirements once baseline data for the new wells is available. Area 303 is another site where annual monitoring has not occurred in several years so annual monitoring will be required at this site until baseline conditions have been established.	Monitoring at the 9 newly installed wells at Former Power Plant Building T-1451 and the ten newly installed wells at Area 303 will be conducted in 2013. The same monitoring that recently occurred at these two sites in April of this year will be again performed in August/ September, except for the 6 wells at Area 303 which were slated for one-time PCE sampling delineation. The monitoring requirements from the URS SAP for the additional new wells and additional analytical parameters for pre-existing wells at these sites will be added to the CMP and will occur in 2013.
7.	Page 8-7	8.6	ADEC concurs with recommendations to discontinue DRO sampling and to reduce monitoring frequency at this site.	The Navy will implement the recommendations.
8.	Page 9-11	9.6	A little confused on recommendations. Line 9 suggests that free product monitoring continue	Page 9-11, line 9, delete the “ <del>annually</del> ”

			frequency at well 05-375.	recommendations.
18.	Page 18-5	18.6	“DRO concentrations have remained <b>at or</b> below endpoint criteria for at least two consecutive sampling events;” Please add the <b>bolded</b> text.	Change made for well 12-203.
19.	Page 18-5	18.6	ADEC concurs with discontinuation of ground water monitoring at this site. ADEC will issue a “Cleanup Complete with IC’s” determination for this site. Please include site monitoring wells in the list of wells to be decommissioned. Stream inspection should be included in IC monitoring requirements, if not already included.	The Navy will implement the recommendations.  After discussions with the Navy on April 17, 2013, ADEC agreed that continuing stream shoreline inspections at this site is not required.  All LTM wells for which monitoring is agreed to be discontinued will be included on the 2013 LTM Wells Repairs List as requiring decommissioning. These wells will be scheduled to be decommissioned during a future event.
20.	Page 19-10	19.6	This site has a potential Surface Water Quality Issue. Free product in the new wells appears to have reduced and the monthly data does not show consistent free product. But increase in sediment concentration is concerning. Recommend postponing the decision on reducing monitoring frequency at this site pending 2013 data? ADEC concurs with reducing monitoring frequency for MW-E006. I don’t necessarily disagree with changing the frequency but one more year of data may increase confidence.	Page 19-10, lines 10 and 11, made the following changes: “...it is recommended that all <b>other</b> monitoring at this site <b>continue as prescribed. If 2013 monitoring results continue to show only incremental changes to previous years’ results, it is recommended that monitoring at the site</b> be reduced to every odd year <del>with the next monitoring to occur in 2013.</del>  Also please see RTC #1.
21.	Page 20-	20.6	ADEC concurs with recommendations to reduce	The Navy will implement the

Comment No.	Document/ Page &Line	Comment/Recommendation	Navy Response April 22, 2013
<b>GENERAL COMMENT</b>			
1	Draft 2012 Annual GWMR	<p><b>Comment:</b> The site-specific figures included in the Draft 2012 Annual Groundwater Monitoring Report Long-Term Monitoring (the 2012 GWMR) display the estimated extent of endpoint criteria exceedances; however, in many cases the extent of these exceedances is not fully supported by groundwater concentration data. For example, Figure 16-2 shows the extent of estimated endpoint exceedances at Solid Waste Management Unit (SWMU) 14, but there are no sample locations west, east, or south of MW14-5, so it is not clear what data were used to support the estimated extent of endpoint criteria exceedances. Please revise the 2012 GWMR to provide sufficient data to support the extent of endpoint criteria exceedances displayed in the site-specific figures. At a minimum the text should discuss the off-figure data points which the Navy is using to make the estimations. The figure should depict groundwater elevations, with flow also.</p>	<p>After discussion with EPA on April 17, 2013, it was agreed that areas of endpoint exceedance would be removed from site figures with insufficient wells to define the areas. In addition, it was agreed that potentiometric surface figures would be deleted from the report since groundwater flow direction has remained constant at all the sites since 2005. The determined groundwater direction flow will be placed on each site figure containing analytical results. Groundwater elevations will continue to be calculated from depths to groundwater measurements collected in the field. Each year, elevations will be compared to historic elevations for each site to verify that the groundwater flow direction has not changed.</p> <p>Extent of contamination was determined during site characterization which occurred at the sites prior to the ROD (1999) or based on individual site Final Decision Documents. This information is summarized in the Site Catalog in the CMP, Rev 5. The wells selected for LTM included both plume source and sentinel wells based on the observed contamination during characterization. Most other monitoring wells used for site characterization and determining contaminant extent have since been decommissioned for which SWMU 14 is an excellent example. Monitoring wells previously installed east and west of the site are no longer in use because cleanup levels were not exceeded; therefore, only two wells 01-153 and MW14-5 were selected for LTM. As demonstrated in Table 2-4 Monitoring History, petroleum contamination had exceeded endpoints in well 01-153 from 2003 to 2007 (located south of well MW14-5) but monitoring was discontinued in 2008 when endpoints were met. This is</p>

Comment No.	Document/ Page &Line	Comment/Recommendation	Navy Response April 22, 2013
			<p>also the case for the other LTM sites.</p> <p>The purpose of the LTM is to monitor concentrations of contaminants in existing wells to show the selected remedy of MNA is occurring and to make changes to the monitoring program in the form of discontinuing or reducing monitoring in wells as endpoints are met. The purpose of illustrating the estimated extent of endpoint exceedances on the report figures is to demonstrate visibly which monitoring wells still require continued monitoring based on annual LTM results for the convenience of the reader. In the interest of not expanding the size of this already large report, the Navy does not believe that it is necessary to define the extent of exceedance to that level by adding a discussion of historic site characterization information to the text.</p> <p>For most sites, groundwater elevations and groundwater flow directions are presented on the first figure (x-1) and sampling results and estimated extent of endpoint exceedances are presented on the second figure (x-2) in that section. Some sites did not have a sufficient number of wells to infer a potentiometric surface and only had one figure for their section. For those sites, an estimated groundwater flow direction was made based on both historical information and topographic surface which is included on the site figure with sampling results.</p>
<b>SPECIFIC COMMENTS</b>			
<b>1</b>	Draft 2012 Annual GWMR Table 2-1 and Page 2-5 Lines 1 through 7	<p><b>Comment:</b> According to page 2-5, Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) sites not associated with landfills include SWMU 14, SWMU 15, SWMU 17, and SWMU 55; however, Table 2-1 lists 13 CERCLA sites, but only two are landfills, which are addressed under a separate monitoring program. Please indicate in the text or on Table 2-1 that Palisades, Metals, and Roberts landfills were addressed via other decision documents than the OU A ROD.</p>	<p>After discussion with EPA on April 17, 2013, it was agreed that the first part of Section 2 in the text through Table 2-3 will be deleted from the report. This is of historical value only and is presented in other documents like the CMP, ROD, and Decision Documents. Section 2 will be revised to focus more on historical and current LTM activities only.</p>
<b>2</b>	Draft 2012 Annual GWMR Table 2-1 and	<p><b>Comment:</b> Table 2-3 does not include all 13 of the CERCLA sites that are listed in Table 2-1 (e.g., SWMU 10). It is understood that some of the 13 CERCLA sites may have been conditionally closed; however, these sites should be included in</p>	<p>Please see RTC to Specific comment 1.</p>

Comment No.	Document/ Page &Line	Comment/Recommendation	Navy Response April 22, 2013
	Table 2-3	the table and the date of conditional closure listed. Please revise Table 2-3 to include all the CERCLA sites that have been listed in Table 2-1 or explain why sites have been excluded.	
3	Draft 2012 Annual GWMR Page 2-5 Lines 30 through 32 and Table 2-2	<b>Comment:</b> According to Page 2-5, “the decision document for SWMU 17 signed in December 2006 designated a selected remedy of monitored natural attenuation (MNA) and ICs [institutional controls];” however, Table 2-2 includes free product recovery and CERCLA compliance monitoring. Please resolve this discrepancy.	Please see RTC to Specific comment 1.
4	Draft 2012 Annual GWMR Table 2-2 and Table 2-3	<b>Comment:</b> Table 2-2 shows that SWMU 10, SWMU 15, SWMU 16, SWMU 20, SWMU 21, SWMU 23, SWMU 24, SWMU 52/53/59, and SWMU 67 have all been conditionally closed (as noted by an asterisk); however, Table 2-3 does not state that SWMU 16 has been conditionally closed. Please revise Table 2-3 to include SWMU 10, SWMU 20, SWMU 21, SWMU 23, SWMU 24, SWMU 52/53/59, and SWMU 67 and include the year these sites received conditional closure. In addition, please revise Table 2-3 to state that SWMU 16 has been conditionally closed and to include the year this site received conditional closure or revise Table 2-2 to indicate that this site was not conditionally closed.	Please see RTC to Specific comment 1.
6	Draft 2012 Annual GWMR Table 2-3	<b>Comment:</b> Table 2-3 states that “in 2012, ADEC [Alaska Department of Environmental Conservation] agreed to grant conditional closure for this site [SWMU 15] in 2004, and long-term monitoring was discontinued;” however, it is not clear whether the closure was issued in 2012 or 2004 and whether long-term monitoring was discontinued in 2012 or 2004. Please revise the text to clarify the year that ADEC granted conditional closure for SWMU 15 and to clarify during which year long-term monitoring was discontinued.	Please see RTC to Specific comment 1.
7	Draft 2012 Annual GWMR Table 2-4	<b>Comment:</b> Table 2-4 shows that well 55-145 at SWMU 55 was not sampled during 2012, but there is no information to explain why this well was not sampled. Please either revise the text or Table 2-4 to explain why well 55-145 was not sampled for SWMU 55.	As per the CMP, monitoring was reduced at this site last year to every odd year.
8	Draft 2012 Annual GWMR Page 3-5 Lines 5 through 8	<b>Comment:</b> In addition to long-term trends, short-term trends (e.g., the most recent four or five data points) should be evaluated to provide a more complete assessment of the data. It is important to acknowledge both short-term and long-term data trends. Please revise the 2012 GWMR to include an evaluation of both long-term and short-term trends.	Short-term trend analysis is not required according to the regulator approved CMP, Revision 5. The historic data collected since the inception of the LTM program on Adak shows that there are slight increases and decreases in data from year to year. These ‘trends’ are not ignored but they have been attributed to tidal cycles, climatic changes from year to year, seasonal precipitation variations and other conditions. In 2013, no variations in short term data such

			as steadily increasing or spiked concentrations over the last five years were observed that would indicate that there was an increase in risk for potential exposure to downgradient receptors. If a sudden increase in concentrations were noted possibly signifying contaminant migration, however, the Navy would notify the EPA and ADEC so that appropriate mitigation measures could be taken, if warranted.
9	Draft 2012 Annual GWMR Page 3-5 Lines 29 through 31	<b>Comment:</b> Page 3-5 states that “trend evaluations were not performed in 2012 for wells that are scheduled to be sampled every odd year and were not sampled in 2012...trends for these wells were conducted in 2011 and are included in the Final 2011 Annual Groundwater Monitoring Report;” however, the text does not specify whether trend evaluations will be performed for these wells in the 2013 Annual GWMR. Please revise page 3-5 to specify whether trend evaluations will be performed for these wells in the 2013 Annual GWMR.	Page 3-5, line 32, added the following: “ <b>Trend evaluations will be performed for wells sampled biennially and reported in the subsequent Annual Groundwater Monitoring Report as prescribed by the CMP, Revision 5 (Navy 2012e).</b> ”
10	Draft 2012 Annual GWMR Page 3-8 Lines 10 and 11	<b>Comment:</b> The text on page 3-8 does not explain how trend analyses were completed for chlorinated volatile organic compounds (VOCs) and daughter products. For example, it is not clear whether concentrations were converted to millimoles to help understand whether degradation or dilution is occurring. Please revise the text to explain how trend analyses were completed for chlorinated VOCs and daughter products.	Trends for VOCs were performed the same way as for petroleum contaminants as stated on page 3-8 lines 24 and 25. This is per the CMP, Rev 5.
11	Draft 2012 Annual GWMR Page 3-8 Lines 16 through 29	<b>Comment:</b> It is unclear whether the procedures address vapor intrusion when plumes are present beneath or in the vicinity of buildings (i.e., preferential pathways along utilities could facilitate vapor movement toward and into buildings). For example, Table 17-2 and Figure 10-2 indicate the VOC groundwater plume is adjacent to Buildings 10203 and 10284 (the Power Plant No. 3). Cis-1,2-dichloroethene (cis-1,2-DCE) and vinyl chloride were detected at 240 micrograms per liter (ug/L) and 2.7 ug/L respectively at well 05-735, which is east of Building 10203 and south of Building 10284. These concentrations are above the endpoint criteria for cis-1,2-DCE (70 ug/L) and vinyl chloride (2 ug/L), so vapor intrusion could occur at these concentrations. In addition, the endpoint criteria for these compounds should be re-evaluated using current vapor intrusion methodology to determine if they are still protective. Please list the sites where groundwater plumes extend near or beneath buildings and discuss in detail the assessment of vapor intrusion at these locations. Please also re-evaluate the endpoint criteria using current vapor intrusion methodology to determine if	The Navy has determined that there are no occupied buildings located on or down gradient of any VOC plumes; therefore, vapor intrusion is not a concern at these sites.

		they are still protective.	
12	Draft 2012 Annual GWMR Section 6 Pages 6-1 through 6-7	<p><b>Comment:</b> Section 6 is qualitative, not quantitative. Each section should include the quantitative results or a quantitative summary. For example, the accuracy discussion indicates that “a small percentage of the 2012 analytical results were qualified as ‘estimated;’ however, the actual percentage is not provided. Another example can be found in the discussion for completeness, which states “completeness for some parameters for some sites was less than the project-specific QC [quality control] goal of 95 percent;” however, the text does not specify which sites did not meet the goal of 95 percent. Please revise Section 6 to include a quantitative discussion of the data.</p>	Appendix G is referenced throughout Section 6 and presents the quantitative analysis of the QC requirements by site and by sample. Specifically, completeness listed as percent by site is presented in Table G-3 of the appendix.
